1. Summary

This report tests the complete life of a layer flock in the revised Top Farm design, where the farm infrastructure (estates, brooding nurseries, sheds, cages) is permanent and the **flock batch is a lot** that moves through it. Every step was performed in a fresh Odoo 20 database: master data and the daily records were entered by scripts, and the key actions (validating receipts and transfers, confirming feed logs, submitting and approving mortality, allocating the flock to the cages, producing eggs, starting the Laying Phase, confirming sales) were clicked in the browser, with a screenshot before and after.

1.1 Workflow tested

1. Products set up for the flock: the bird product (lot-tracked, Is Live Farm Bird), feed and vaccines with their Farm Input Type, graded egg products.
2. Purchase of 10,000 day-old chicks, received into the main warehouse under the hatchery batch number **20_10_2026**; purchase of feed and medicine.
3. Transfer of 5,000 chicks to the Ihalapannawa brooding nursery: a **new flock batch number IHL-20-10-2026** is created on validation (Approach B), with its own analytic account. The other 5,000 go to Baddegama with a batch number typed by the clerk (Approach A).
4. Brooding (weeks 0-4): starter feed, vaccines, electrolytes and LPG heating given to the flock, brooding mortality with the 2 % manager approval, and the **brooding-stage expenses of the batch in analytic accounting**.
5. Split of the flock into 5 cages with the Brooding-to-Cage wizard; the flock moves to Pre-Laying.
6. Pre-laying rearing in the cages: grower feed and vitamins expensed directly, debeaking labour, cage mortality; analytic items carry the flock **and** the cage.
7. First eggs and the 50 % rolling hen-day alert; the Farm Manager starts the Laying Phase and the pre-laying investment is locked.
8. Laying: feed staged per cage, egg collections, graded manufacturing orders consuming the feed, egg lots linked to the flock, laying analytics.
9. Sale of the eggs and of the spent hens, invoices tagged to the flock, flock marked Spent; lifetime P&L and ledger reconciled.
10. Reuse of the permanent cages: the next chick purchase becomes a new flock in the same brooding nursery and the same 5 cages; the cage analytic accounts keep both flocks apart.

1.2 Results by step

Step	Checks	Passed	Result
Configuration and master data	5	5	PASS
Purchase into the main warehouse	5	5	PASS
Dispatch to brooding, automated flock lot (Approach B)	3	3	PASS
Dispatch with manual flock lot (Approach A)	8	8	PASS
Brooding: feed, vaccines, heating, mortality	3	3	PASS
Cage allocation and pre-laying rearing	6	6	PASS
Point of lay: 50 % hen-day transition	9	9	PASS
Laying: staged feed and graded egg MOs	6	6	PASS
Sales: eggs and spent hens	7	7	PASS
Independent verification (analytics, investment, P&L, ledger)	50	50	PASS
Cage reuse by the next flock	22	22	PASS

All 124 checks are listed in section 14. Section 15 records the defects found and fixed during this test.

1.3 Key figures of flock IHL-20-10-2026

Figure	Value
Birds placed / at point of lay / sold as spent hens	5,000 / 4,882 / 4,882
Pre-laying investment (locked at point of lay)	LKR 1,479,500.00 = LKR 303.05 per bird (target LKR 1,200.00 - 1,300.00)
Brooding-stage expenses (weeks 0-4)	LKR 601,500.00
Egg revenue / spent hen revenue	LKR 249,000.00 / LKR 3,173,300.00
Total direct cost / gross operating profit	LKR 1,545,500.00 / LKR 1,876,800.00

1.4 Simulations (read before the figures)

- **Time:** all transactions are posted on the test day (20 October 2026). To reach the Laying Phase, the flock's chick arrival date was moved back 18 weeks (16 June 2026) and its cage allocation 14 weeks, and the first egg collections were dated 13-19 October. The flock ages, the 17-week minimum and the rolling hen-day therefore behave as in real life; the brooding and rearing records themselves carry the test date.
- **End of cycle:** the spent hens are sold right after the first laying day instead of after 70-75 weeks, so that the flock's lifetime P&L can be closed within the test.
- **Quantities** are reduced to one or two feed logs per stage; the amounts are realistic per bird (LKR 150 chick, LKR 120-140 per kg feed).

2. Test environment and method

Item	Value
Odoo	20.0 Enterprise, Python 3.12, PostgreSQL 16, Windows 11
Apps installed	Top Farm (4 modules), Inventory, Purchase, Sales, Manufacturing, Accounting
Company	Top Farm, currency LKR, time zone Asia/Colombo
Users	Farm Manager (Admin): Farm Manager and Mortality Manager roles; Farm Operator: Farm Operator and Mortality Operator roles. The operator records the daily feed, mortality and egg logs and submits the brooding mortality in the browser; the manager allocates, approves and starts the Laying Phase.
Valuation	All farm product categories in automated (perpetual) valuation; consumption, mortality and production locations carry their expense / clearing accounts
Analytic plans	Flock Batches (one account per flock, created automatically) and Farm Cages (one account per cage)

2.1 How the evidence was produced

- Data phases (`test_scripts/data/p*.py`) run in `odoo-bin shell` as the Farm Operator or the Farm Manager and record their checks in `results/checks.json`.
- Browser phases (`test_scripts/browser/s*.js`, Playwright + Chrome, 1600 px) click the business buttons and save every screenshot with its caption in `results/shots.json`.
- Phase p10 recomputes every expected amount from the source documents (quantity x purchase price, birds x standard cost) and compares it with the analytic items, the reports and the general ledger.
- The whole run (`run_all.sh`) was executed once, in order, on a freshly installed database; the screenshots of this report all come from that run.

3. Configuration and products for the flock

The Top Farm settings choose the flock lot generation (Approach B, automated, from the chick arrival date), create one analytic account per flock, and set the laying benchmark (50 % rolling 7-day hen-day from 17 weeks, manager confirmation). The infrastructure is permanent: two estates with their estate codes, a brooding nursery each, a laying shed with 5 cages (each with its own cage analytic account) at Ihalapannawa, and a battery row at Baddegama.

Product	Type	Tracking	Cost (LKR)	Used for
Layer Bird - Brown (Hy-Line)	Live Farm Bird	Lots (hatchery, then flock)	150.00	Chicks to spent hens
Starter Crumbs (Weeks 0-4)	Feed	-	140.00 / kg	Brooding
Grower Mash (Weeks 5-18)	Feed	-	130.00 / kg	Rearing in cages
Layer Mash (Week 19+)	Feed	-	120.00 / kg	Laying (egg MO component)
Marek's Vaccine (dose)	Medication / Vaccine	-	58.00	Brooding
Newcastle ND-IB Vaccine (dose)	Medication / Vaccine	-	12.00	Brooding
Electrolyte & Vitamin Mix (L)	Medication / Vaccine	-	900.00 / L	Brooding and rearing
Egg - Large / Medium / Jumbo / Damaged	Graded eggs	Lots (daily flock egg lot)	from production	Sold at 45 / 40 / 50 / 20

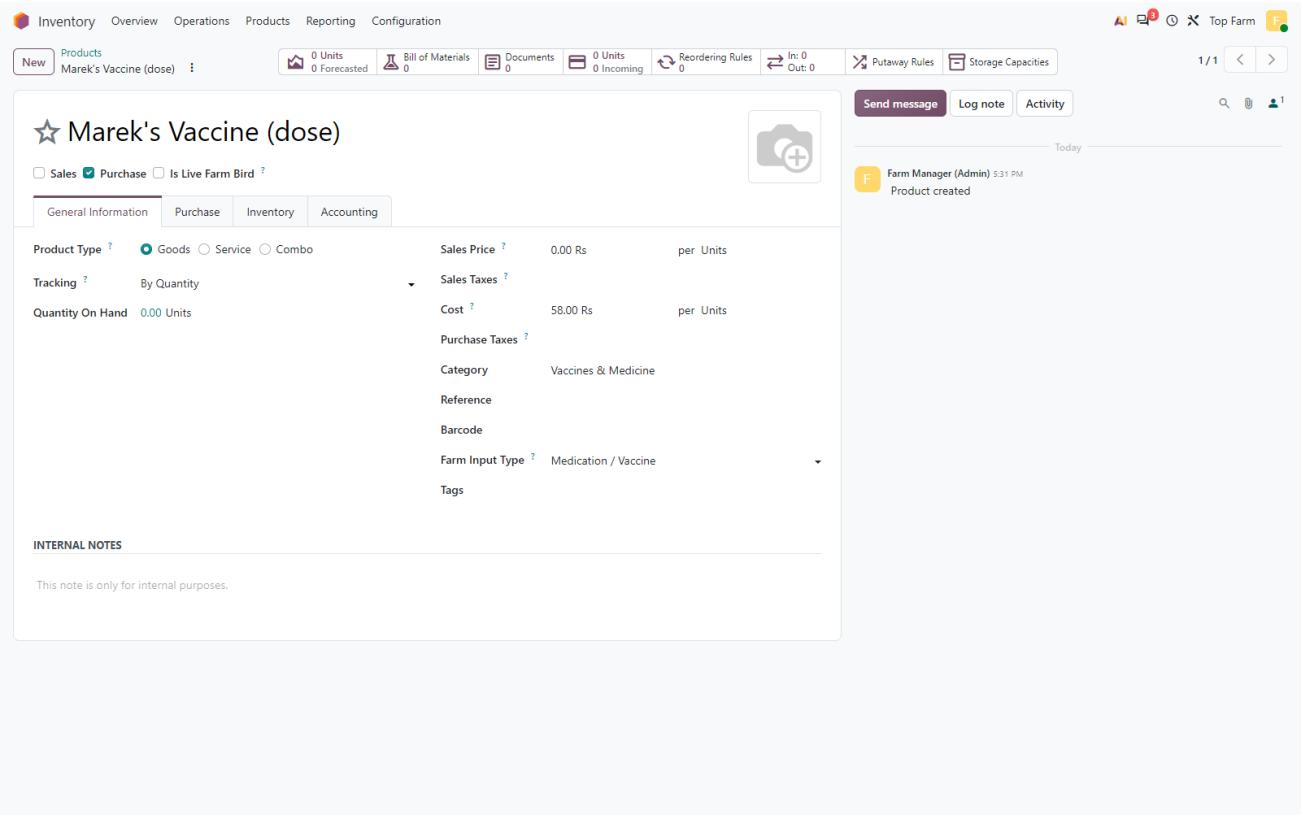

Figure 9. Medicine product Marek's Vaccine (dose): Farm Input Type = Medication / Vaccine, cost LKR 58.

Figure 10: Product category Live Birds

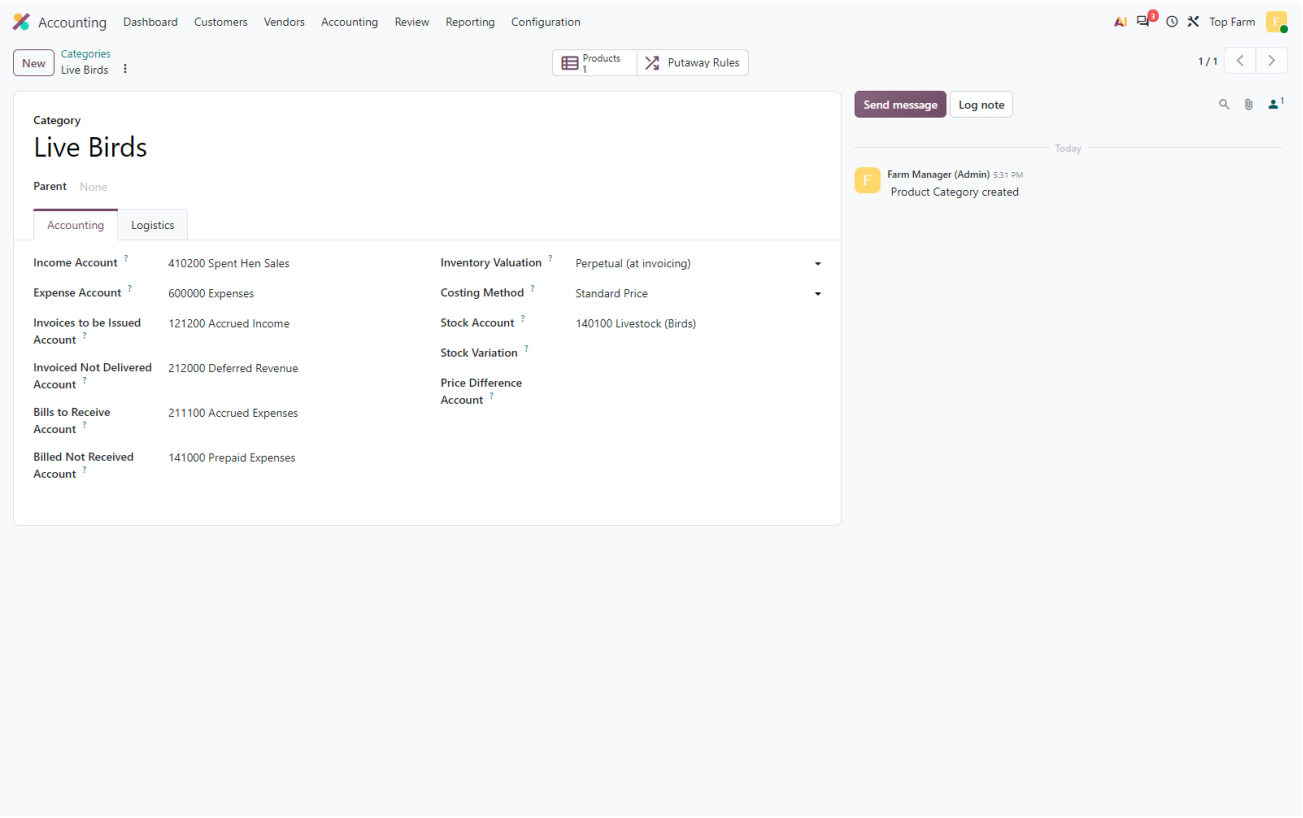

Figure 10. Product category Live Birds: automated (perpetual) inventory valuation at standard price, stock account 140100 Livestock (Birds).

4. Purchase into the main warehouse with the hatchery batch number

The chicks are bought from the hatchery and received into the main warehouse (WH/Stock). The hatchery batch number **20_10_2026** is entered on the receipt line, so the chicks are stored under that lot; validating the receipt stamps the lot with the Chick Arrival Date. The hatchery lot is **not** a flock: the flock batch number is created when the chicks leave for an estate.

PO	Vendor	Product	Qty	Unit	Price	Subtotal
P00001	Hatchery Supplier (Test)	Layer Bird - Brown (Hy-Line)	10,000	Units	150.00	1,500,000.00
P00002	Feed Mill Supplier (Test)	Starter Crumbs (Weeks 0-4)	1,000	kg	140.00	140,000.00
P00002	Feed Mill Supplier (Test)	Grower Mash (Weeks 5-18)	1,500	kg	130.00	195,000.00
P00002	Feed Mill Supplier (Test)	Layer Mash (Week 19+)	1,000	kg	120.00	120,000.00
P00003	Vet Pharma Supplier (Test)	Marek's Vaccine (dose)	10,000	Units	58.00	580,000.00
P00003	Vet Pharma Supplier (Test)	Newcastle ND-IB Vaccine (dose)	10,000	Units	12.00	120,000.00
P00003	Vet Pharma Supplier (Test)	Electrolyte & Vitamin Mix (L)	50	L	900.00	45,000.00

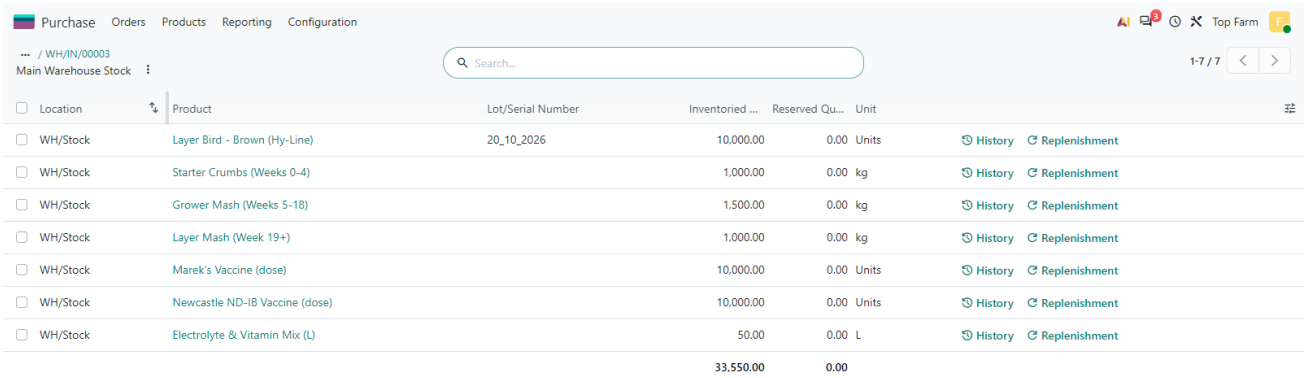

Figure 20. Main warehouse stock after the purchases: 10,000 chicks under hatchery lot 20_10_2026, the feed (kg) and the medicine (doses, litres). The footer total adds different units and has no meaning.

5. Transfer to the brooding nursery: a new flock batch number

The 5,000 chicks for Ihalapannawa are transferred from WH/Stock to **Brooding-01**. Odoo moves a lot unchanged, so on validation the chicks arrive under the hatchery lot and are immediately re-labelled under the flock lot through the virtual location *Flock Lot Conversion*: out under 20_10_2026, back in under the new flock lot, at the same value. The flock lot is named **[Estate Code]-[Chick Arrival Date] = IHL-20-10-2026**, gets the Brooding stage and its own analytic account in the Flock Batches plan.

Flock lot	Estate	Lot creation	From hatchery lot	Birds placed	Chick cost (LKR)	Analytic account	Stage at end of test
IHL-20-10-2026	Ihalapannawa Estate	Approach B - automated (arrival date)	20_10_2026	5,000	750,000.00	[IHL-20-10-2026] IHL-20-10-2026	Spent / Depleted
BDG-20-10-2026	Baddegama Estate	Approach A - manual entry	20_10_2026	5,000	750,000.00	[BDG-20-10-2026] BDG-20-10-2026	Brooding

The re-labelling posts no journal entry and leaves the stock value of the birds unchanged (checks TC-10-02 and TC-10-03).

				0.00 Rs	0.00 Rs	0.00 Rs

Figure 29. The Flock Batches plan now holds the account IHL-20-10-2026, created automatically with the flock lot; cages keep their Farm Cages accounts.

5.1 Approach A: the clerk types the flock batch number

With the Flock Lot Generation Mode set to manual entry, a dispatch to a brooding nursery cannot be validated until the clerk enters the flock lot in the Flock Lot column of the transfer line. The Baddegama chicks were dispatched this way as **BDG-20-10-2026**; the lot was completed on validation (Flock Batch, estate, arrival date, analytic account) exactly like a generated one.

Figure 30: Approach A (manual entry)

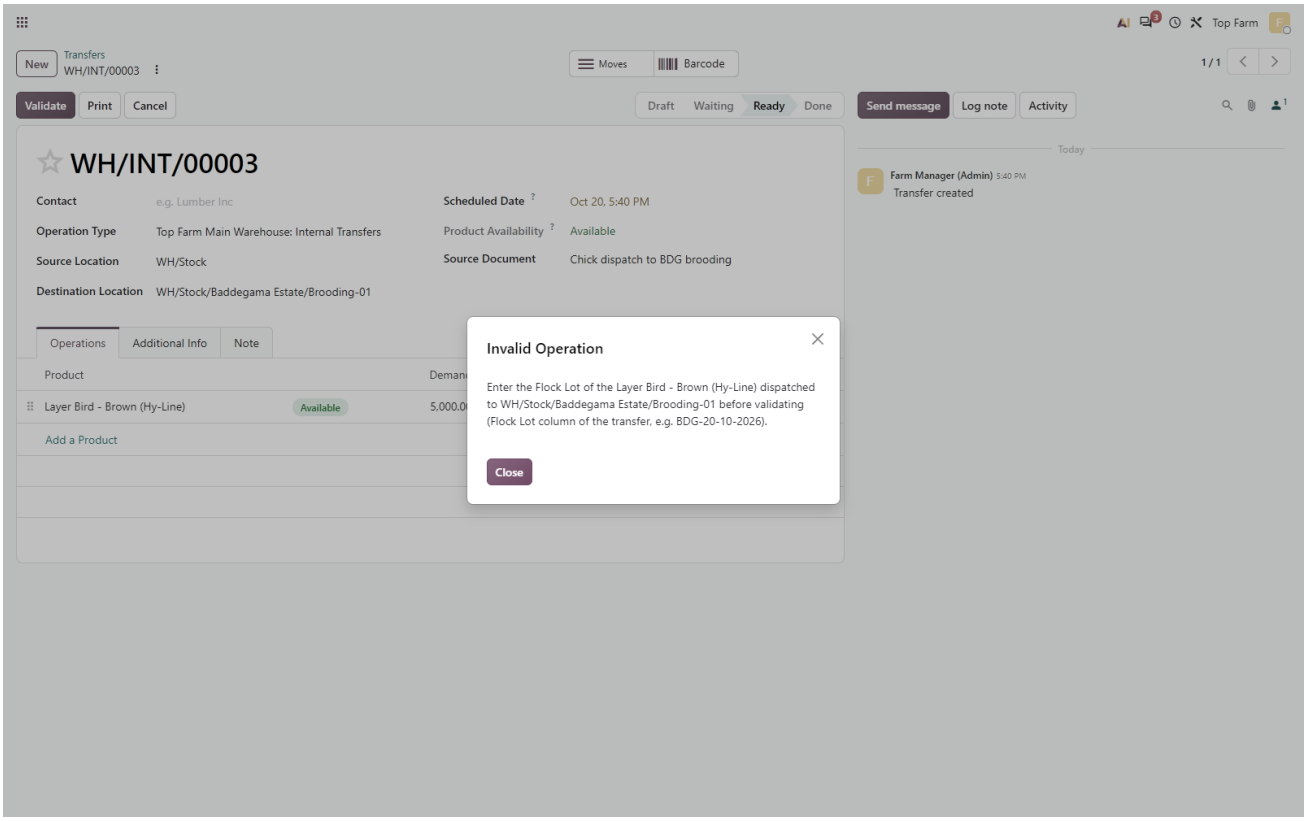

Figure 30. Approach A (manual entry): validating the dispatch to Baddegama Brooding-01 without a flock lot is refused; the message suggests the name built from the estate code and the arrival date.

Figure 31: The clerk types the flock lot BDG-20-10-2026 in the Flock Lot column of ...

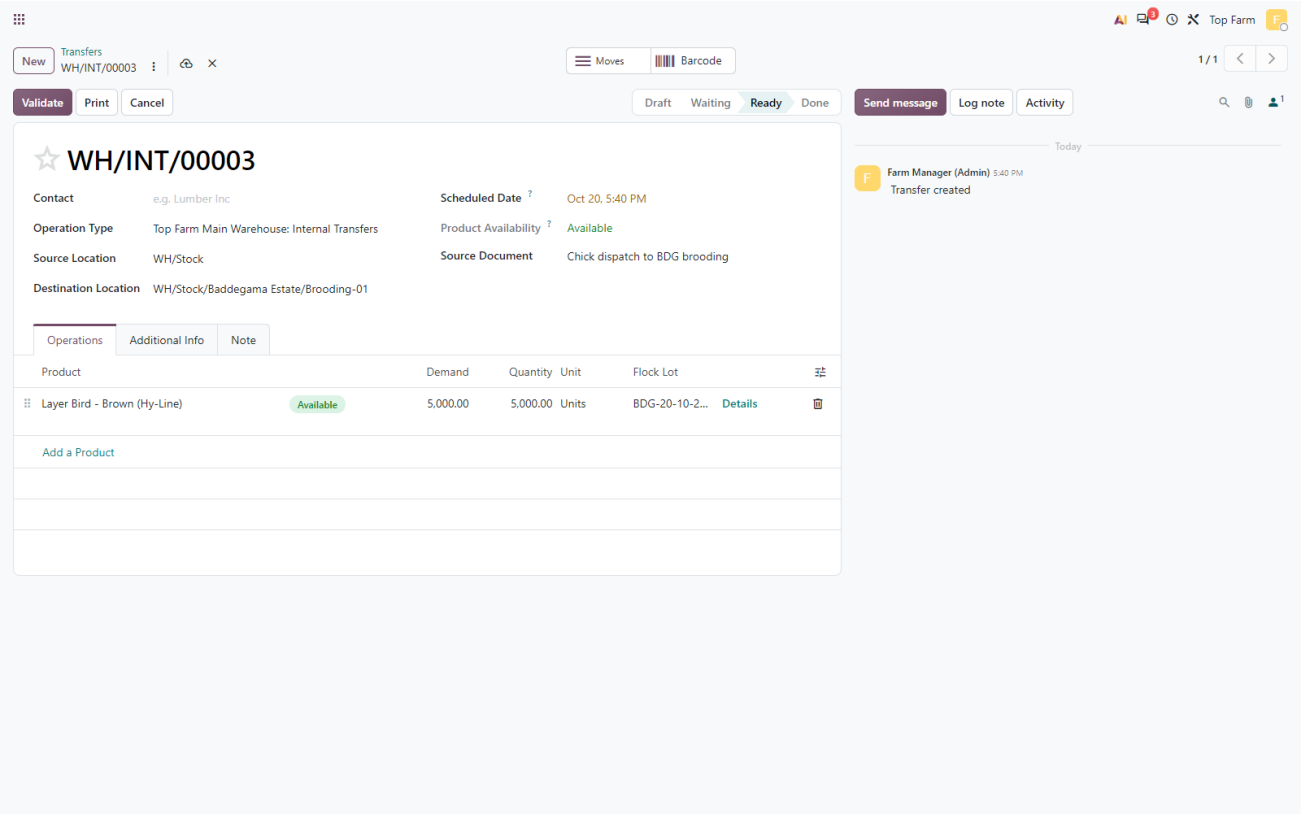

Figure 31. The clerk types the flock lot BDG-20-10-2026 in the Flock Lot column of the dispatch line.

Figure 32: Dispatch WH/INT/00003 validated (Done)

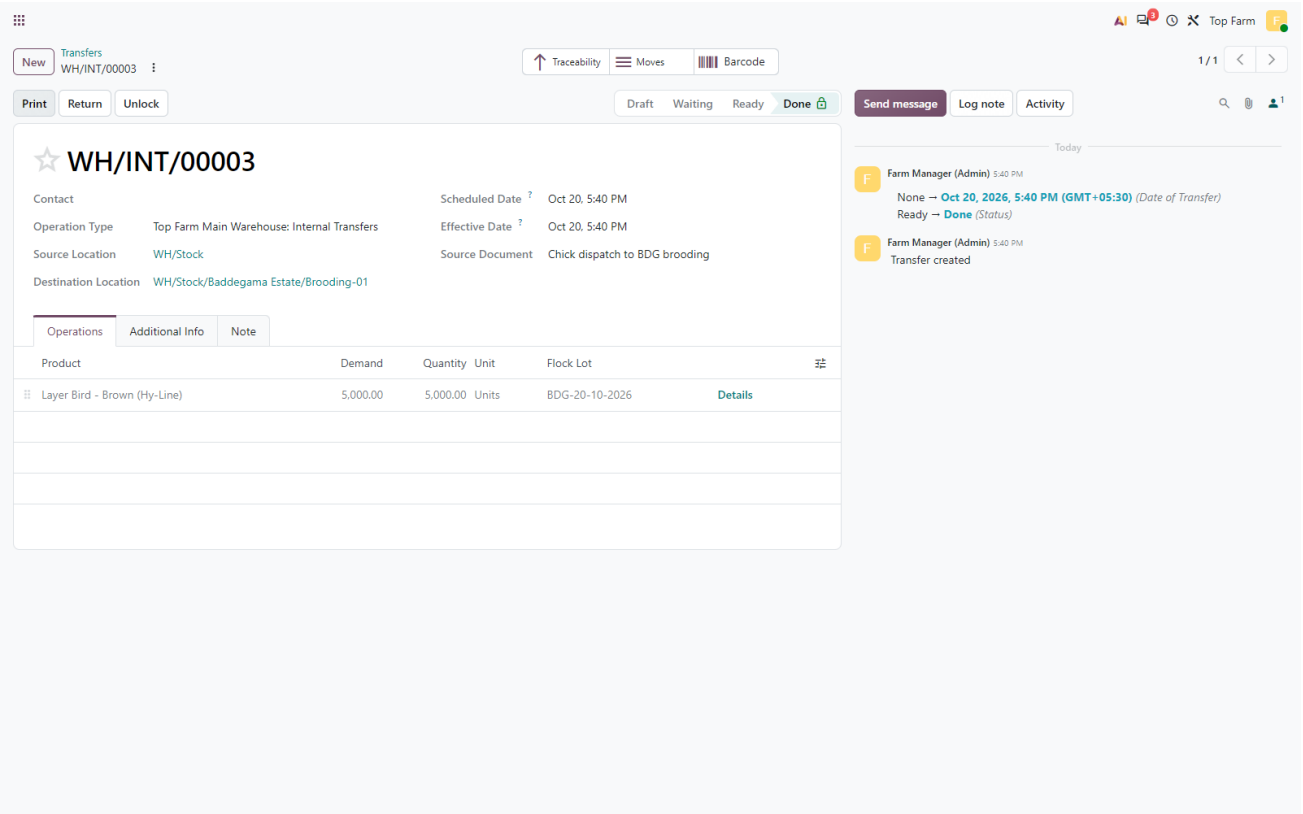

Figure 32. Dispatch WH/INT/00003 validated (Done): the line carries the clerk-entered flock lot BDG-20-10-2026. The 5,000 chicks were re-labelled from hatchery lot 20_10_2026 on validation, as the flock lot's chatter shows on the next figure.

Figure 33: Flock lot BDG-20-10-2026 completed at validation

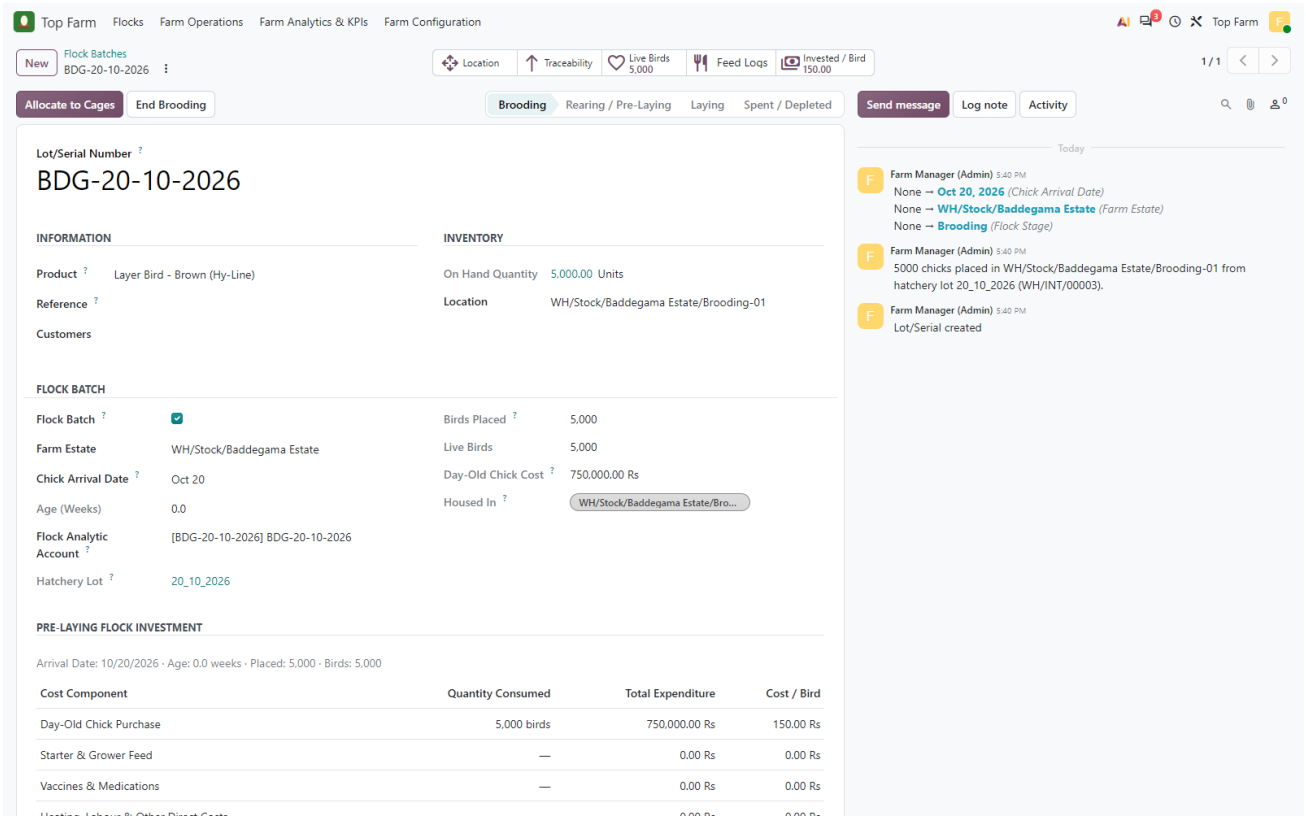

Figure 33. Flock lot BDG-20-10-2026 completed at validation: Brooding stage, Baddegama Estate, arrival date from the hatchery lot, own Flock analytic account.

6. Brooding stage: feed, vaccines, heating and mortality

During weeks 0-4 the chicks stay under heat in Brooding-01. The Farm Operator logs the feed and medication **on the brooding nursery** (no cage); the flock is filled in automatically. Brooding feed and medication are a direct expense of the flock and are consumed at once. The LPG heating bill is charged to the flock analytic account. Two brooding logs were recorded: FEED/2026/00001 (shown being confirmed) and FEED/2026/00002 (confirmed by the Farm Operator). Brooding mortality is checked against the 2 % cumulative daily threshold of the flock in the nursery: the operator submits, the manager approves above the threshold.

6.1 Brooding-stage expenses of the batch (analytic accounting)

Every brooding cost is an analytic item on the flock account **IHL-20-10-2026** only (Farm Cages column empty). Expected amounts are recomputed from the logs and bills:

Expense	Quantity	Unit cost	Expected (LKR)	Analytic actual (LKR)	Accounts	Result
Starter Crumbs (Weeks 0-4)	400	140.00	56,000.00	56,000.00	Flock only	PASS
Marek's Vaccine (dose)	5,000	58.00	290,000.00	290,000.00	Flock only	PASS
Newcastle ND-IB Vaccine (dose)	5,000	12.00	60,000.00	60,000.00	Flock only	PASS
Electrolyte & Vitamin Mix (L)	10	900.00	9,000.00	9,000.00	Flock only	PASS
Layer Bird - Brown (Hy-Line) (mortality)	110	150.00	16,500.00	16,500.00	Flock only	PASS
LPG & electricity bill (brooding heat)	1	170,000.00	170,000.00	170,000.00	Flock only	PASS
Total brooding stage			**601,500.00**	**601,500.00**		PASS

Figure 34: Daily feed & medication log FEED/2026/00001 in Brooding-01

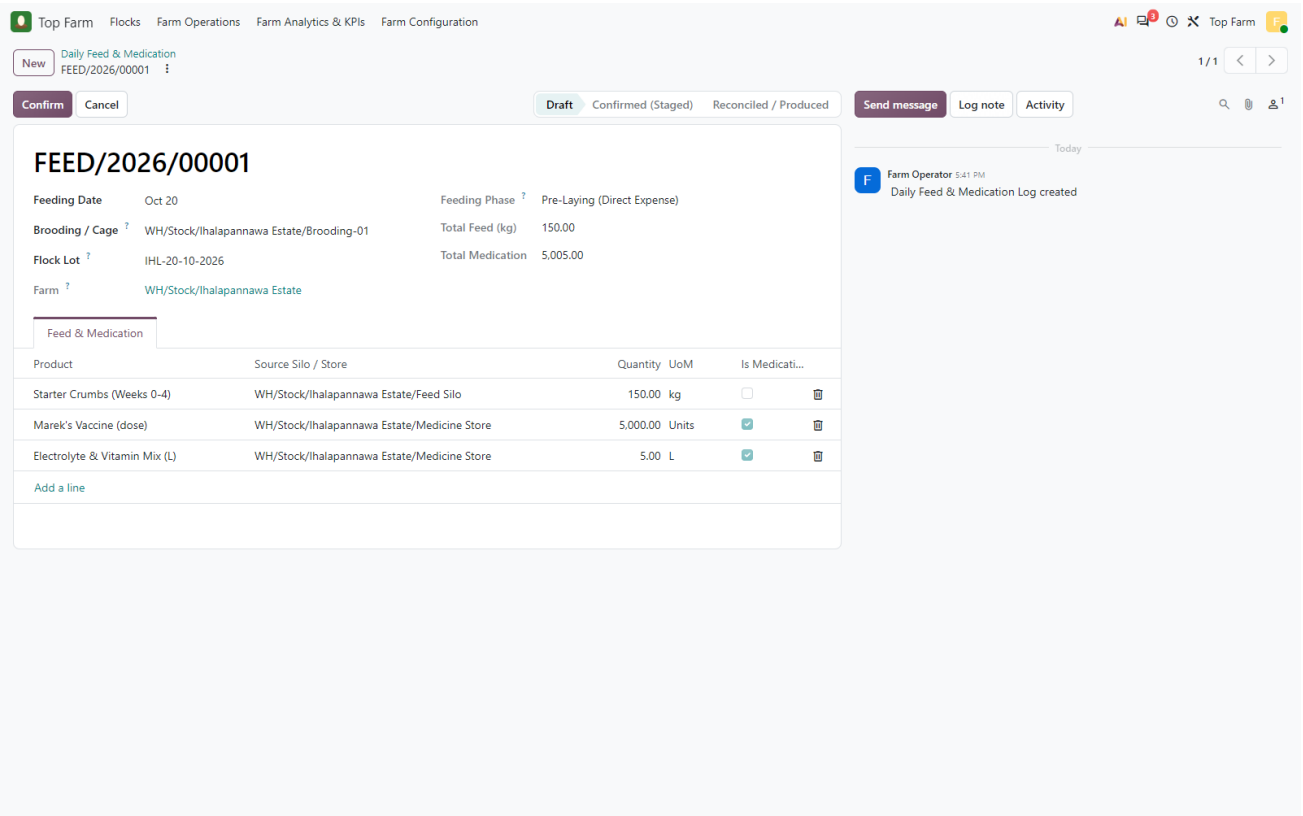

Figure 34. Daily feed & medication log FEED/2026/00001 in Brooding-01, recorded by the Farm Operator: the flock IHL-20-10-2026 is filled in from the nursery, no cage is needed. Starter Crumbs 150 kg, Marek's vaccine 5,000 doses, Electrolyte & Vitamin Mix 5 L (the Total Medication field adds doses and litres).

Figure 35: Confirmed

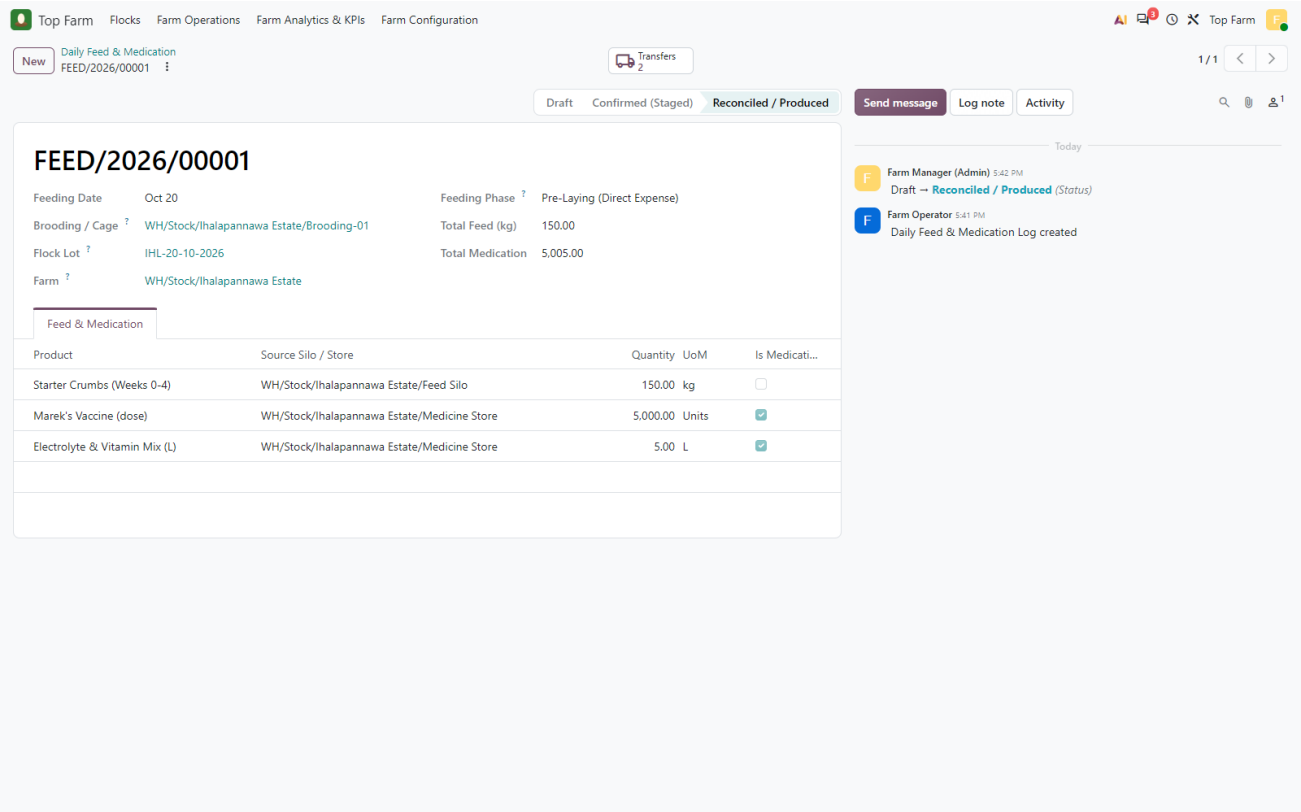

Figure 35. Confirmed: brooding feed and medication are expensed at once (Pre-Laying, Reconciled), through two consumption transfers.

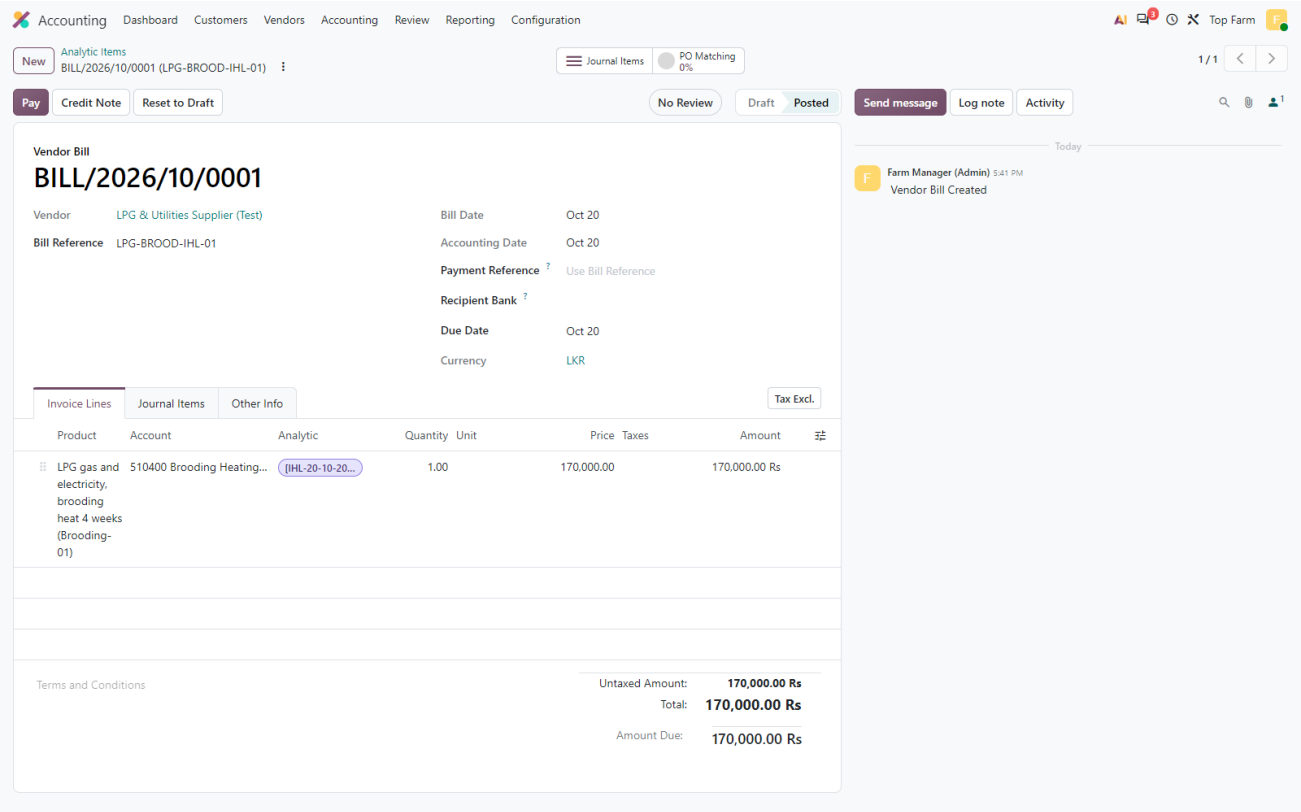

Figure 39. Vendor bill for LPG & electricity, 4 brooding weeks (LKR 170,000 on 510400 Brooding Heating), charged 100 % to the flock analytic account IHL-20-10-2026 (see the analytic items further on).

Figure 40: The Farm Operator records 50 dead chicks of flock IHL-20-10-2026 in ...

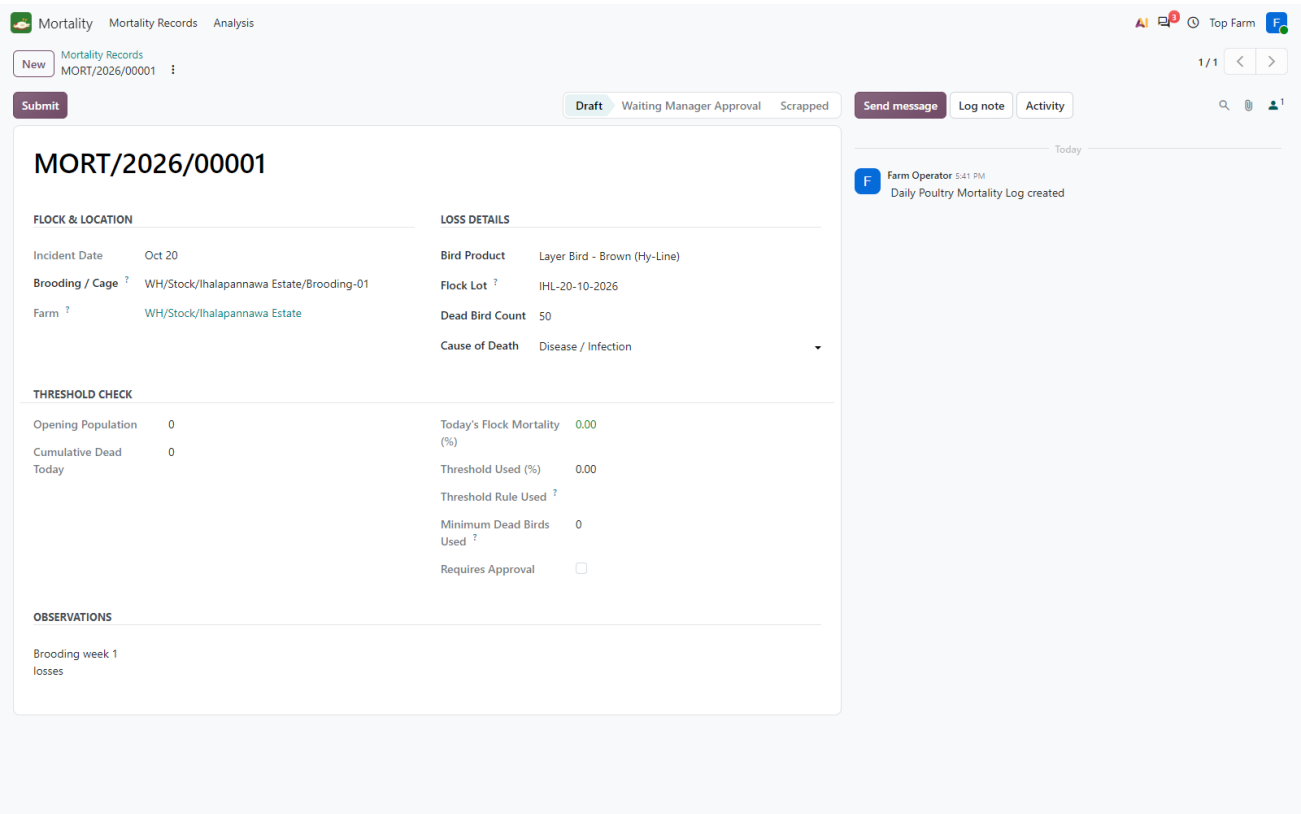

Figure 40. The Farm Operator records 50 dead chicks of flock IHL-20-10-2026 in Brooding-01 (cause Disease / Infection), in Draft.

Figure 41: Submitted by the Farm Operator

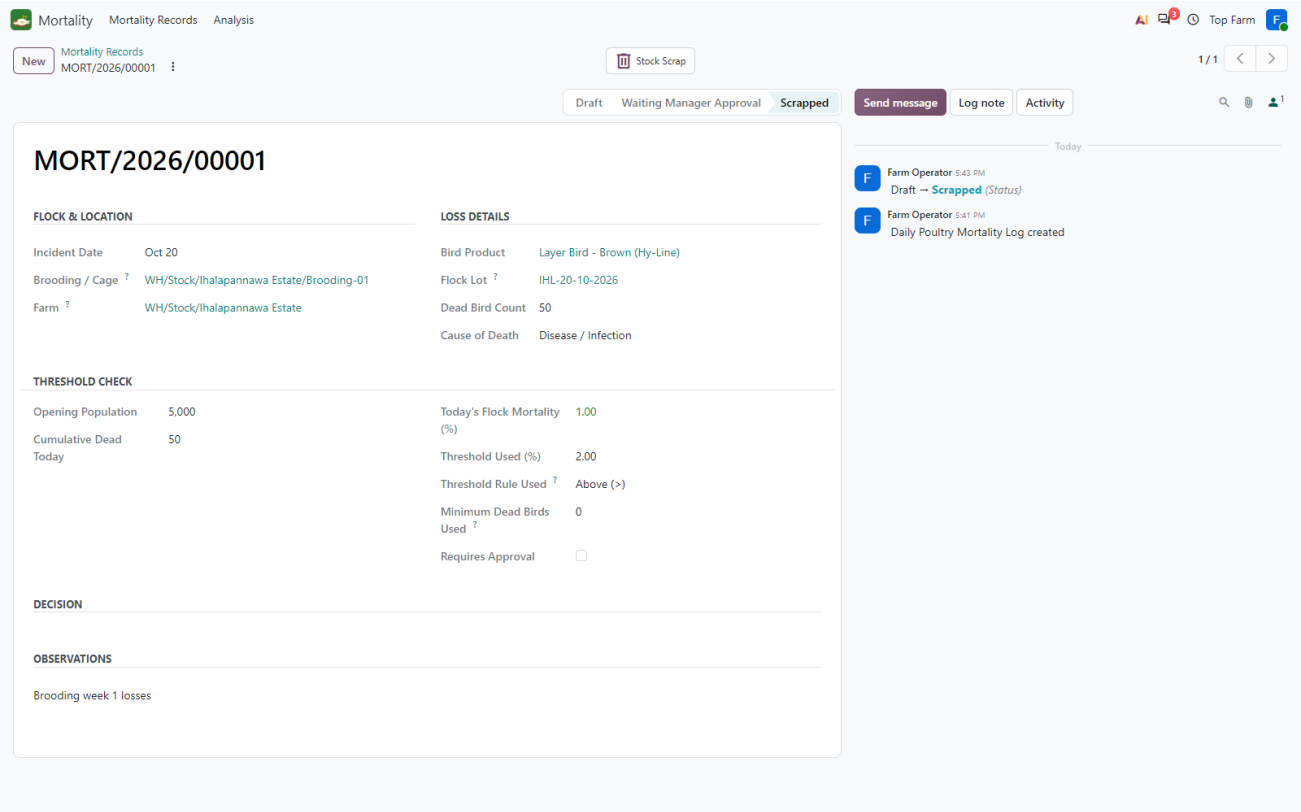

Figure 41. Submitted by the Farm Operator: 50 of the 5,000 opening birds (1.00 %, not above the 2 % threshold) are scrapped at once.

Figure 42: Another 60 chicks the same day

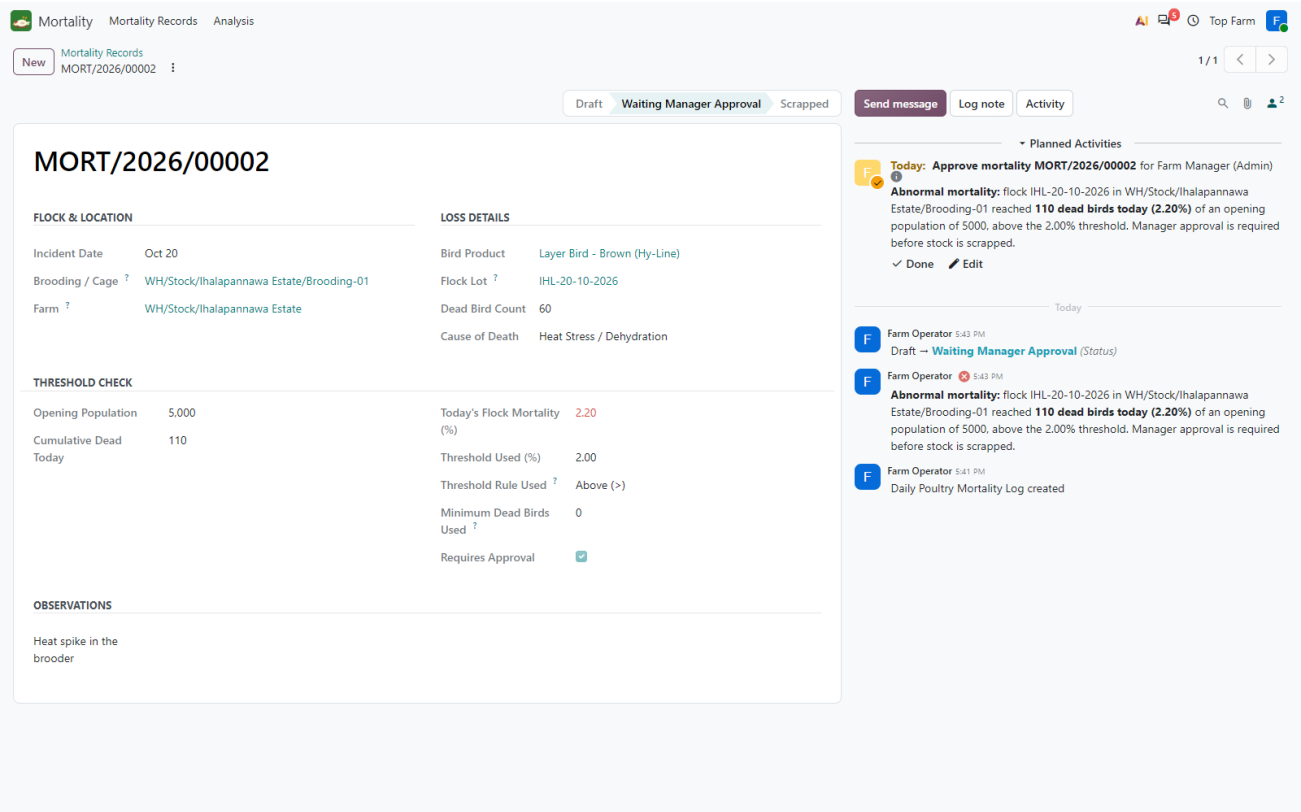

Figure 42. Another 60 chicks the same day: 110 cumulative = 2.20 % > 2 %. The operator cannot scrap them: the log waits for the Farm Manager, who gets a chatter alert and a To-Do.

Figure 43: The Farm Manager approves

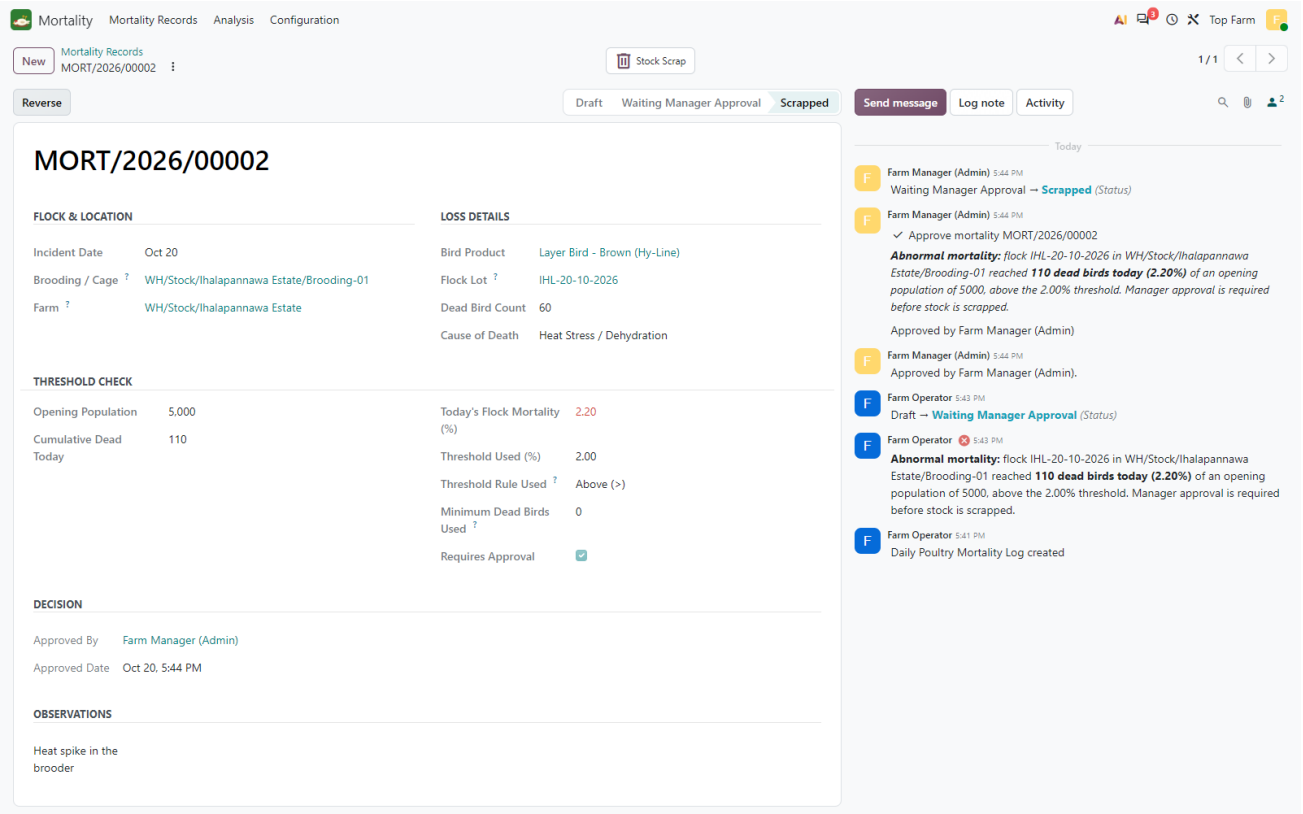

Figure 43. The Farm Manager approves: the 60 chicks are scrapped; Approved By and Approved Date are recorded, the To-Do is closed.

Figure 44: Mortality records of Brooding-01 for flock IHL-20-10-2026

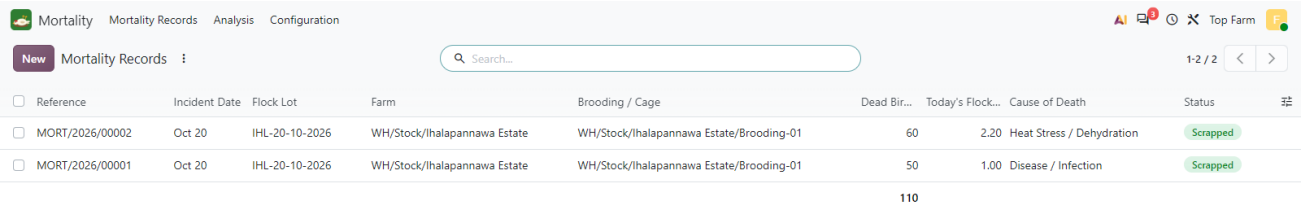

Figure 44. Mortality records of Brooding-01 for flock IHL-20-10-2026: MORT/2026/00001 (50 chicks, 1.00 %) and MORT/2026/00002 (60 chicks, 2.20 % cumulative), both Scrapped: 110 dead.

Figure 45: Analytic items of flock IHL-20-10-2026 in the brooding stage (LKR -601,500)

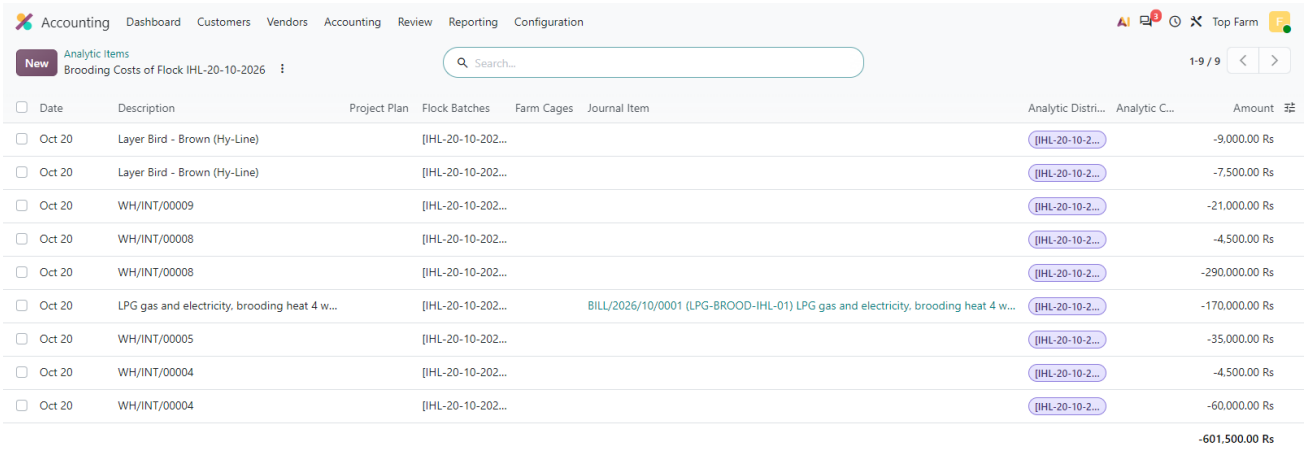

Figure 45. Analytic items of flock IHL-20-10-2026 in the brooding stage (LKR -601,500): the transfers of FEED/2026/00001 and FEED/2026/00002 (starter feed, Marek's and Newcastle vaccines, electrolytes), the two mortality scraps (50 + 60 chicks, shown with the bird product name) and the LPG bill. Every line carries the Flock account only; the Farm Cages column is empty.

Figure 46: Brooding-stage expenses of the batch by product (negative = cost)

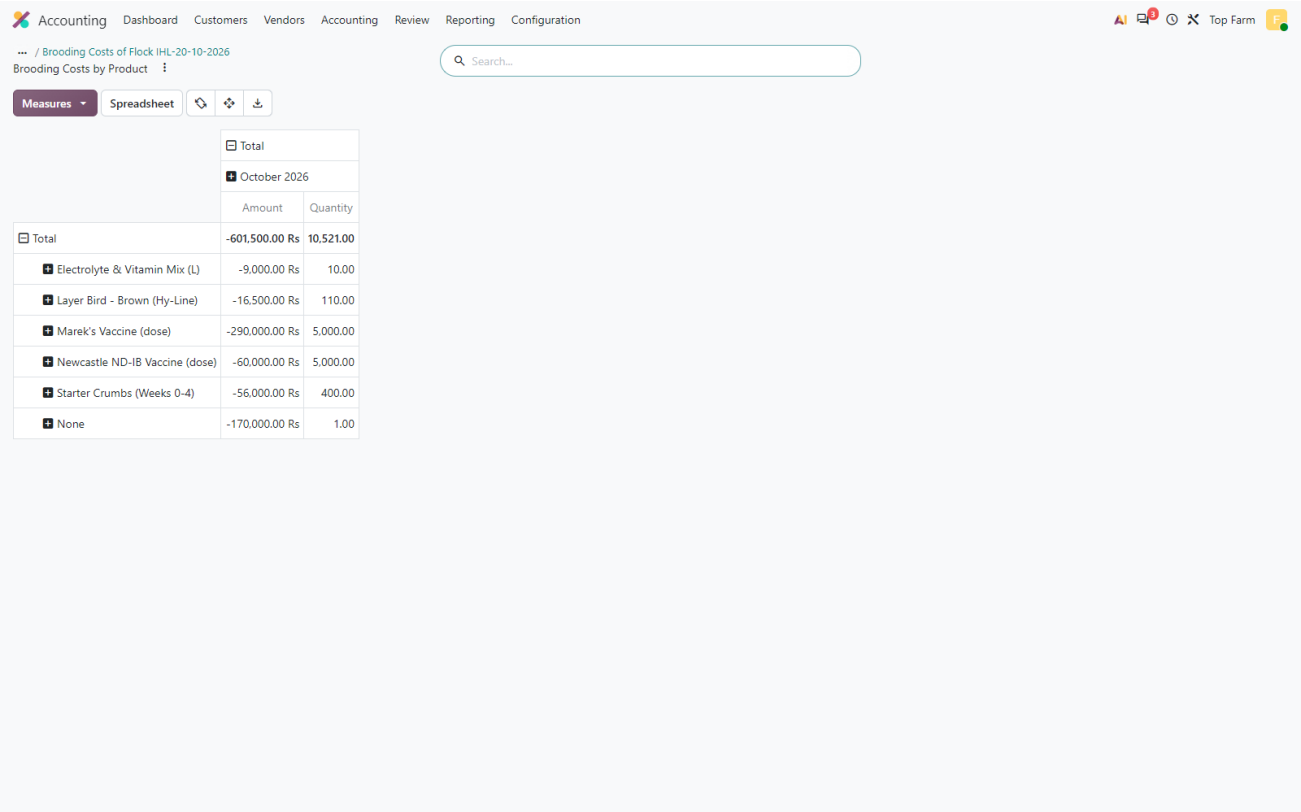

Figure 46. Brooding-stage expenses of the batch by product (negative = cost): starter feed 400 kg, vaccines, electrolytes 10 L, mortality 110 birds; the line without product is the LPG heating bill. Total LKR 601,500.

Figure 47: Pre-Laying Flock Investment after the brooding records (still dated on ...

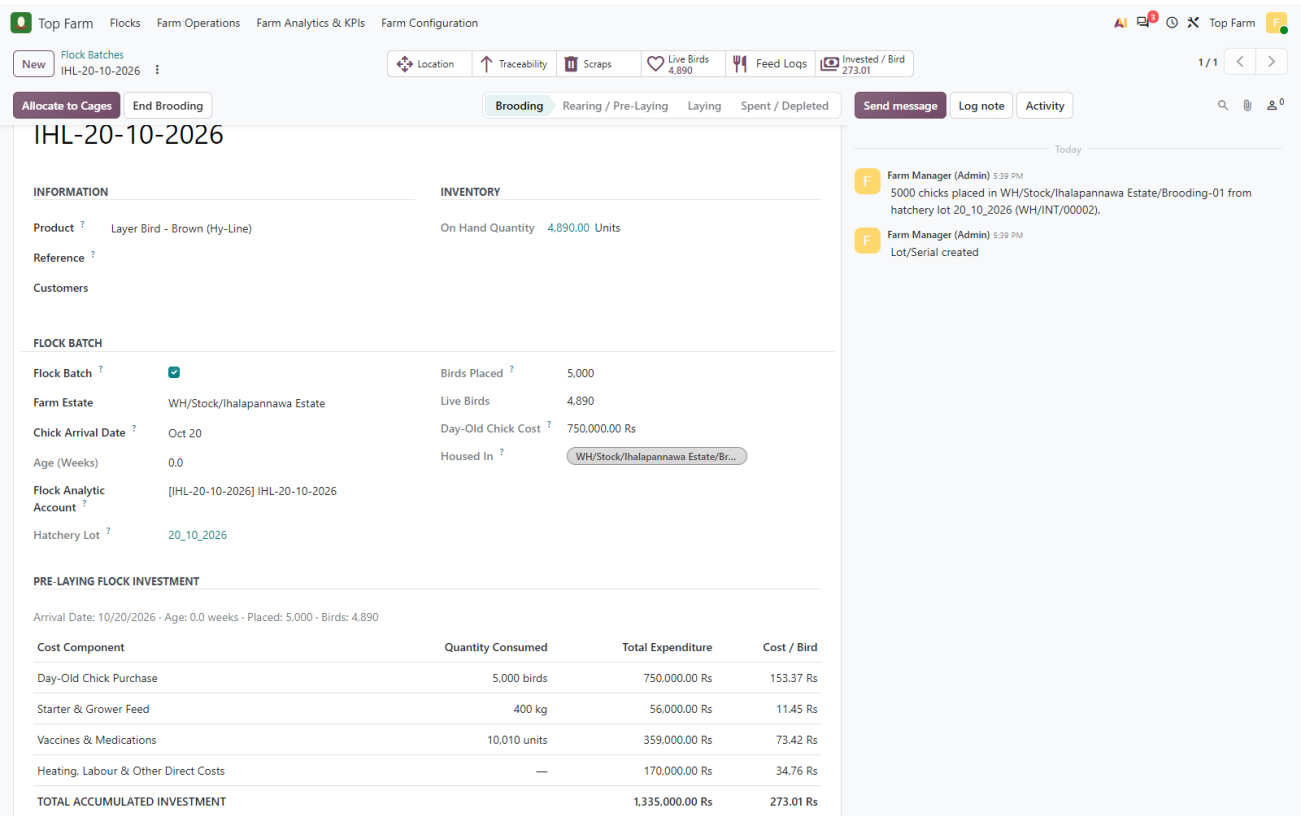

Figure 47. Pre-Laying Flock Investment after the brooding records (still dated on the test day, age 0.0 weeks, before the arrival date is moved back): chicks LKR 750,000, starter feed LKR 56,000, vaccines and electrolytes LKR 359,000 (the quantity mixes doses and litres), LPG heating LKR 170,000 = LKR 273.01 per live bird. Brooding mortality is not added: the dead chicks are already in the chick cost.

7. Splitting the flock into cages (pre-laying)

At the end of brooding (about week 4 in production; on the test day here) the Farm Manager opens the **Brooding-to-Cage Allocation** wizard from the nursery: it detects the flock and its 4,890 surviving birds and lists the cages of the estate with their occupancy. Split Equally gives 978 birds to each of the 5 cages. One validated transfer moves the birds, **keeping the flock lot IHL-20-10-2026**, and the flock advances to Rearing / Pre-Laying.

Figure 48: Brooding-01 holds 4,890 surviving birds of flock IHL-20-10-2026 (5

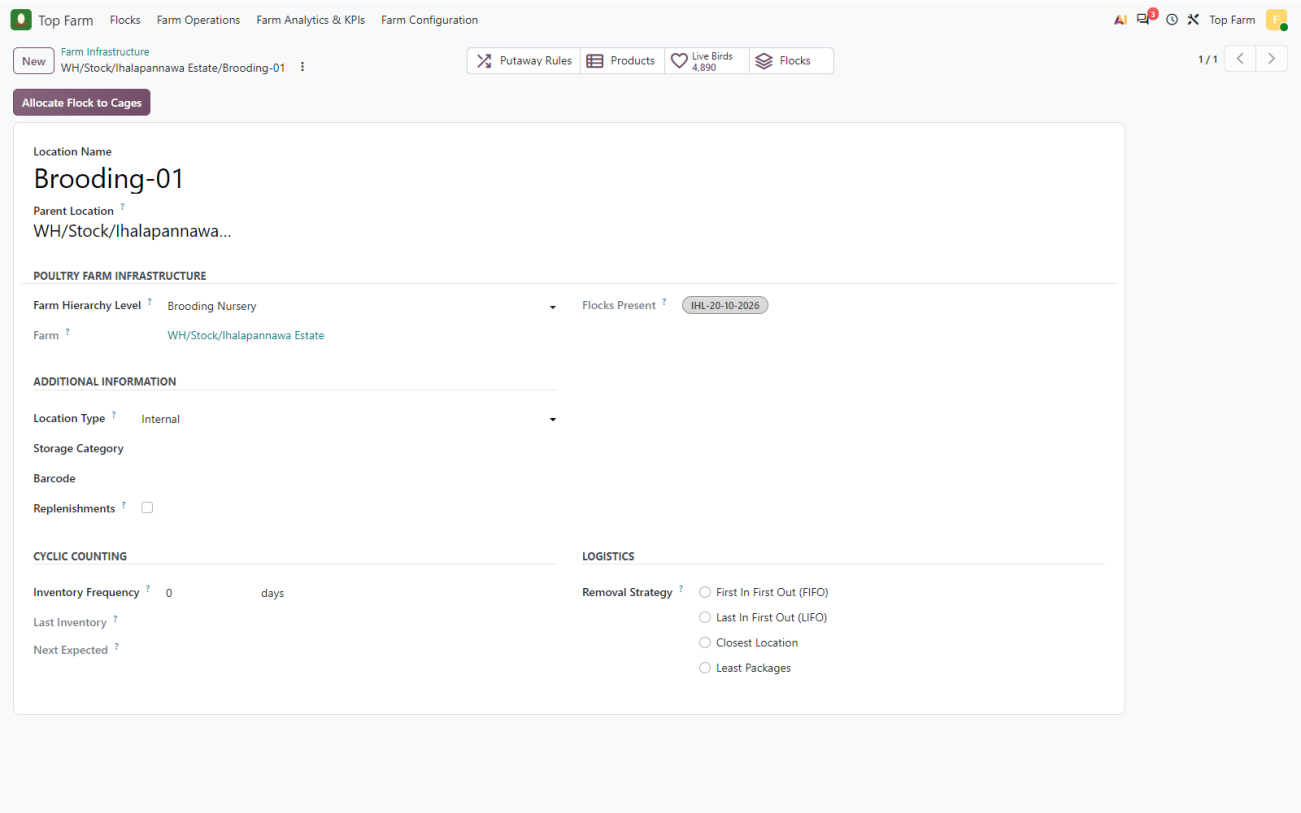

Figure 48. Brooding-01 holds 4,890 surviving birds of flock IHL-20-10-2026 (5,000 placed - 110 dead); the Farm Manager clicks Allocate Flock to Cages. In production this happens at about week 4; in the test it is done on the test day, before the flock age is simulated.

Figure 49: Brooding-to-Cage Allocation wizard

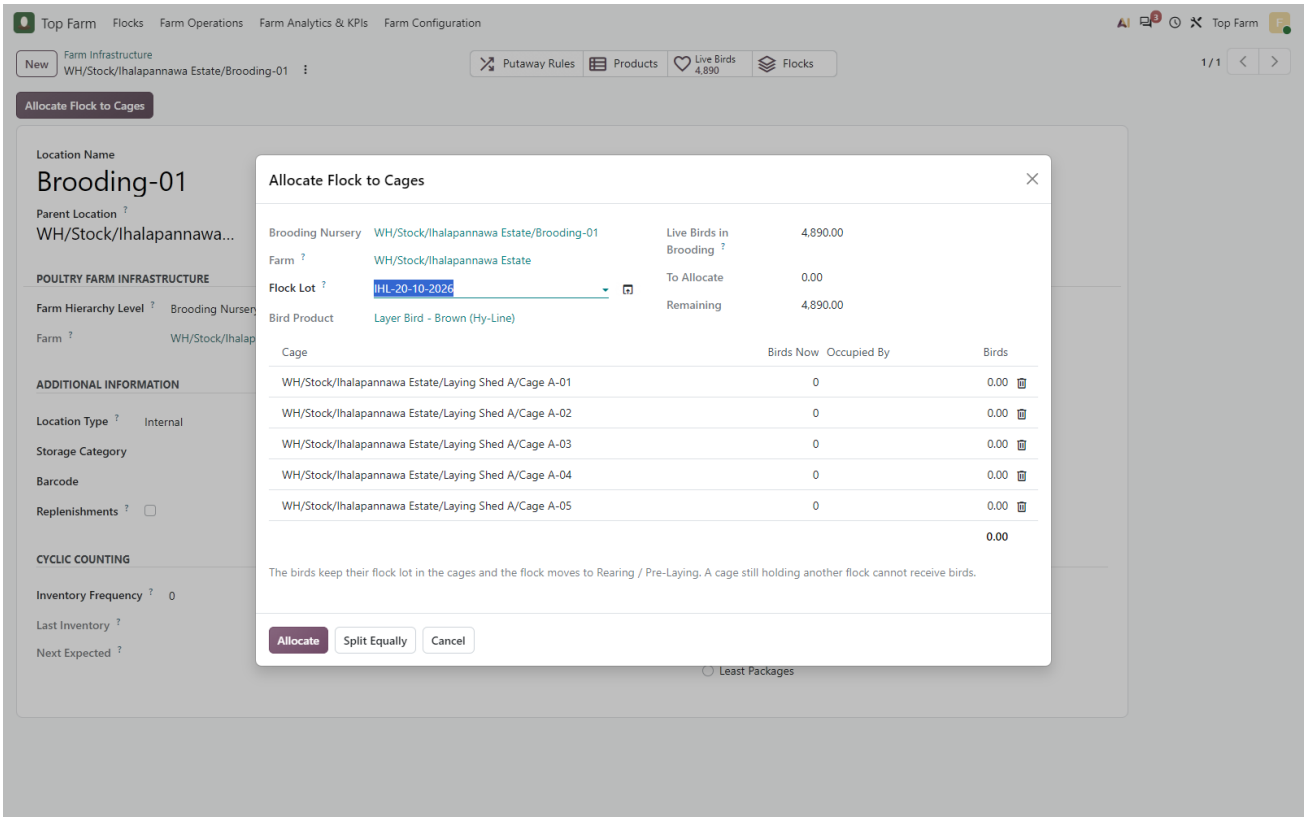

Figure 49. Brooding-to-Cage Allocation wizard: source nursery and flock lot detected, 4,890 live birds, the 5 cages of the estate listed with their current occupancy (all empty).

Figure 50: Split Equally

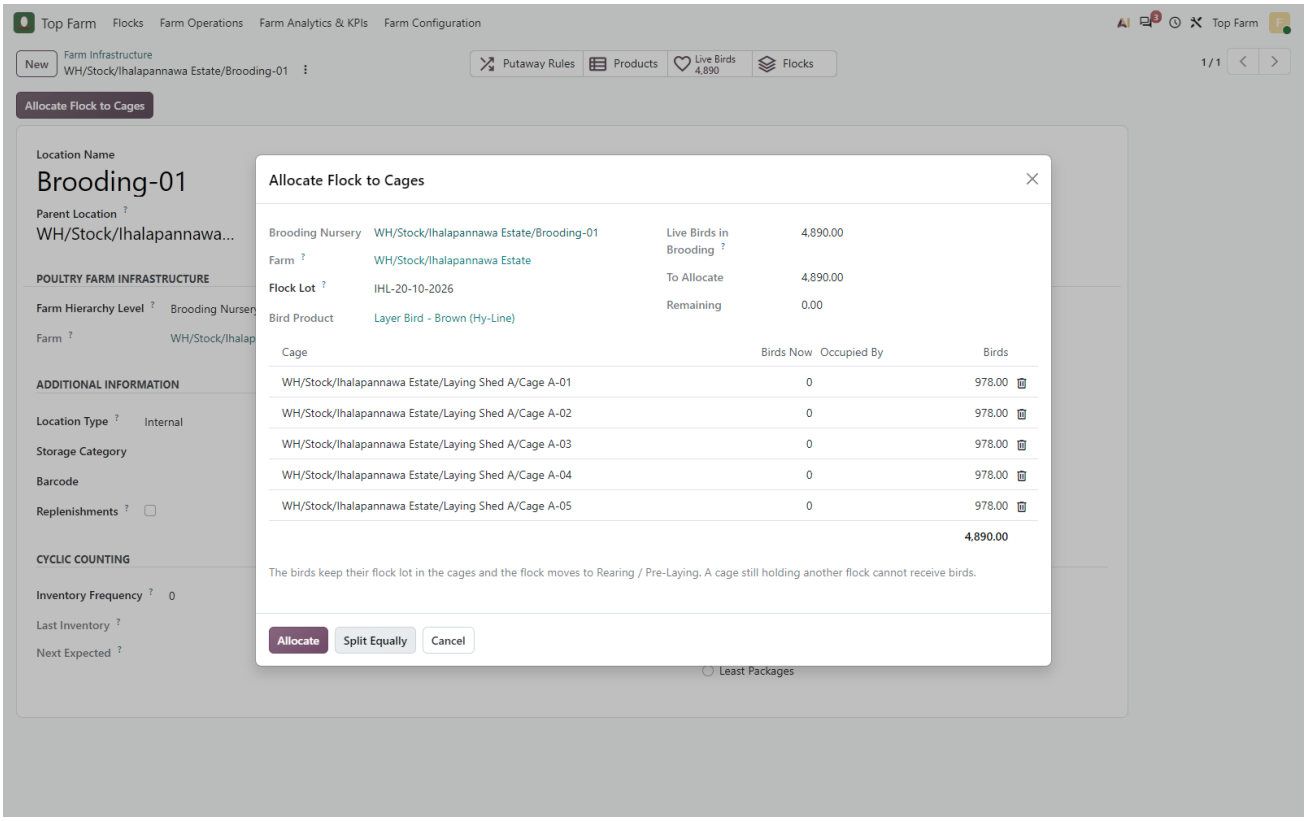

Figure 50. Split Equally: 978 birds per cage (5 x 978 = 4,890), nothing left in brooding.

Figure 51: The flock keeps its lot number IHL-20-10-2026 in the cages and moves to ...

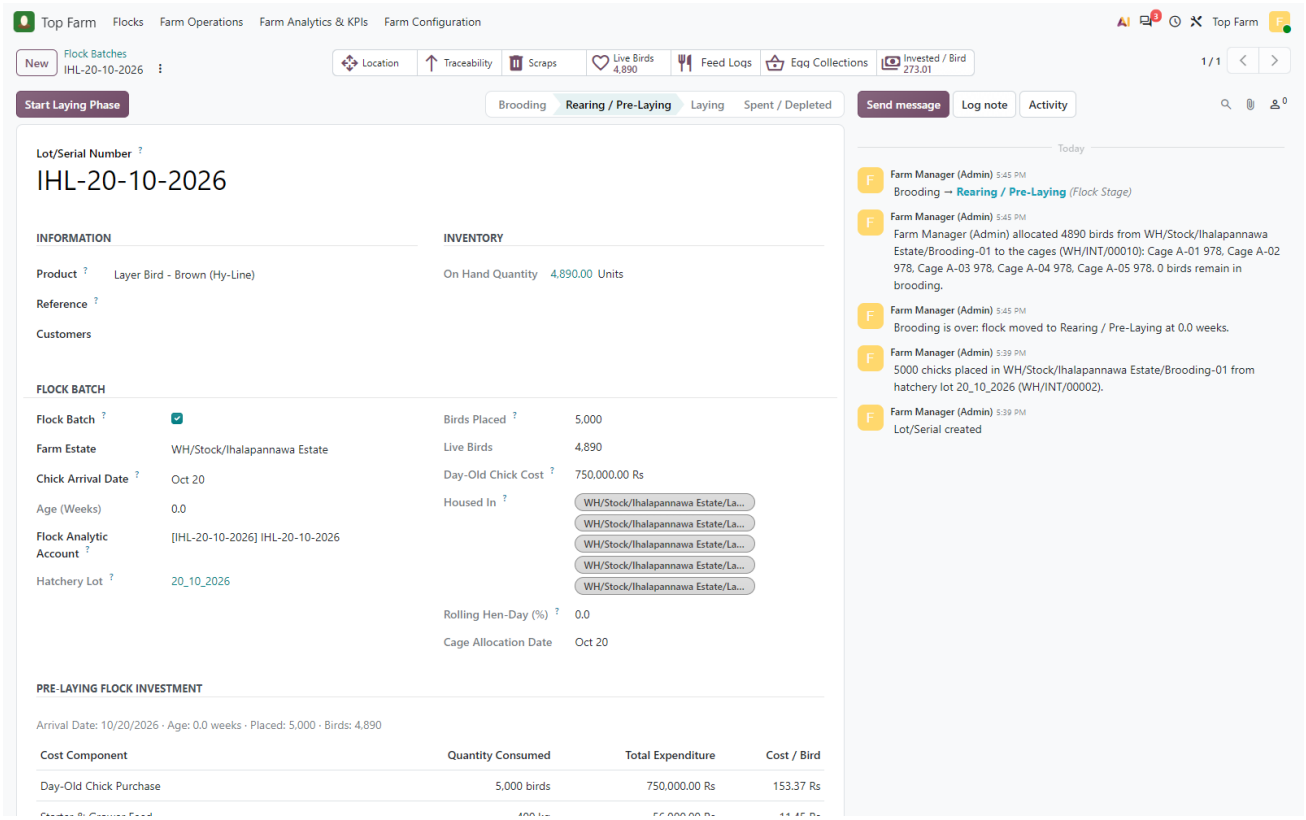

Figure 51. The flock keeps its lot number IHL-20-10-2026 in the cages and moves to Rearing / Pre-Laying; the chatter records the allocation. (Age 0.0 weeks and allocation on 20 October: the flock age is simulated later, before the point of lay.)

Figure 52: Moves of the allocation transfer

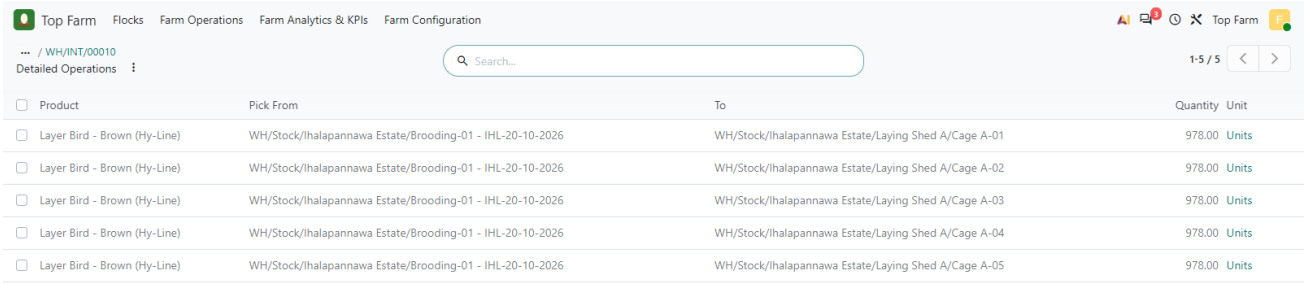

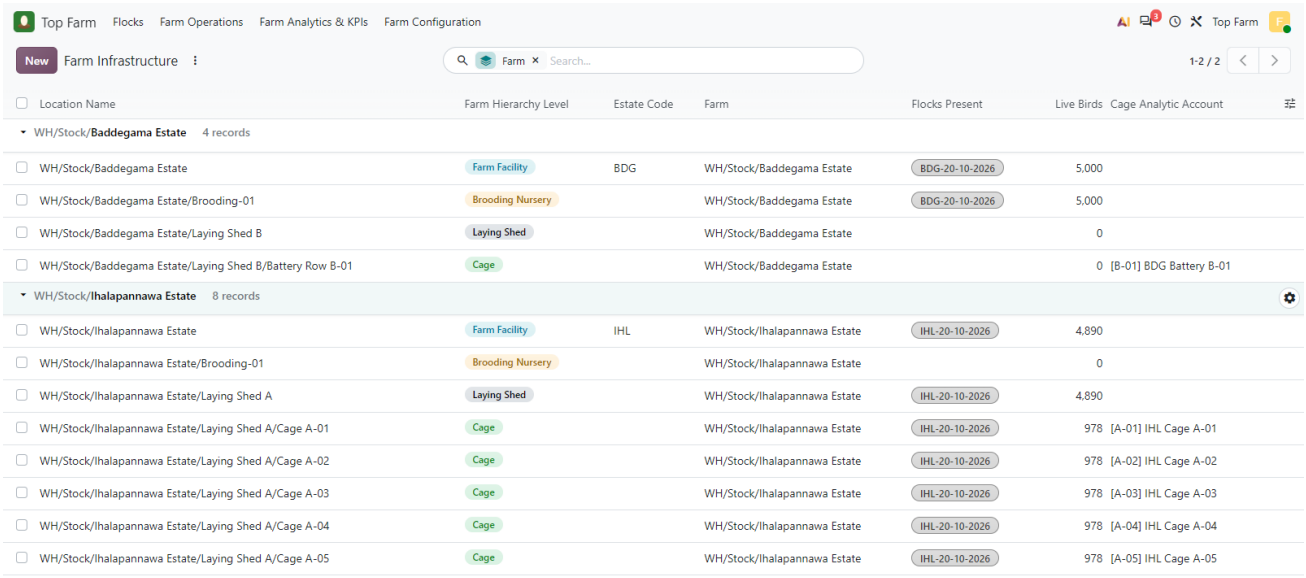

Figure 52. Moves of the allocation transfer: 978 birds from Brooding-01 to each of Cage A-01 to A-05, all under flock lot IHL-20-10-2026.

Figure 53. Farm infrastructure after the allocation: Brooding-01 is empty and each cage of Laying Shed A holds 978 birds of IHL-20-10-2026.

8. Pre-laying rearing in the cages

From now on the daily logs are per cage. Rearing feed and medication are still a **direct expense** of the flock (they build the pre-laying investment), but each cost lands on **one analytic line holding both the flock account and the cage account**, so the cost is reported per flock and per cage without being counted twice.

8.1 Rearing costs per cage (analytic accounting)

Cage	Grower Mash 100 kg	Vitamins 1 L	Mortality	Expected (LKR)	Analytic actual (LKR)	Result
Cage A-01	13,000.00	900.00	750.00	14,650.00	14,650.00	PASS
Cage A-02	13,000.00	900.00	0.00	13,900.00	13,900.00	PASS
Cage A-03	13,000.00	900.00	450.00	14,350.00	14,350.00	PASS
Cage A-04	13,000.00	900.00	0.00	13,900.00	13,900.00	PASS
Cage A-05	13,000.00	900.00	0.00	13,900.00	13,900.00	PASS

The debeaking labour bill (LKR 75,000) is charged to the flock account only, like the LPG bill.

8.2 Pre-Laying Flock Investment

The investment report accumulates, per flock, the chicks placed and every feed, medication and direct cost tagged to the flock until the Laying Phase starts; laying feed and mortality scraps are excluded (the chick cost already counts every bird placed). Locked on 2026-10-20 over 4,882 birds at point of lay:

Cost component	Expected (LKR)	Report (LKR)	Per bird (LKR)	Result
Day-Old Chick Purchase	750,000.00	750,000.00	153.63	PASS
Starter & Grower Feed	121,000.00	121,000.00	24.78	PASS
Vaccines & Medications	363,500.00	363,500.00	74.46	PASS
Heating, Labour & Other Direct Costs	245,000.00	245,000.00	50.18	PASS
TOTAL ACCUMULATED INVESTMENT	**1,479,500.00**	**1,479,500.00**	**303.05**	PASS

Target benchmark LKR 1,200.00 - 1,300.00 per bird; remaining pre-laying budget at lock: LKR 896.95 per bird (the test flock only received a few sample feed logs: two brooding logs and one rearing log per cage).

Figure 54: Rearing feed log FEED/2026/00004 in Cage A-01 of Laying Shed A

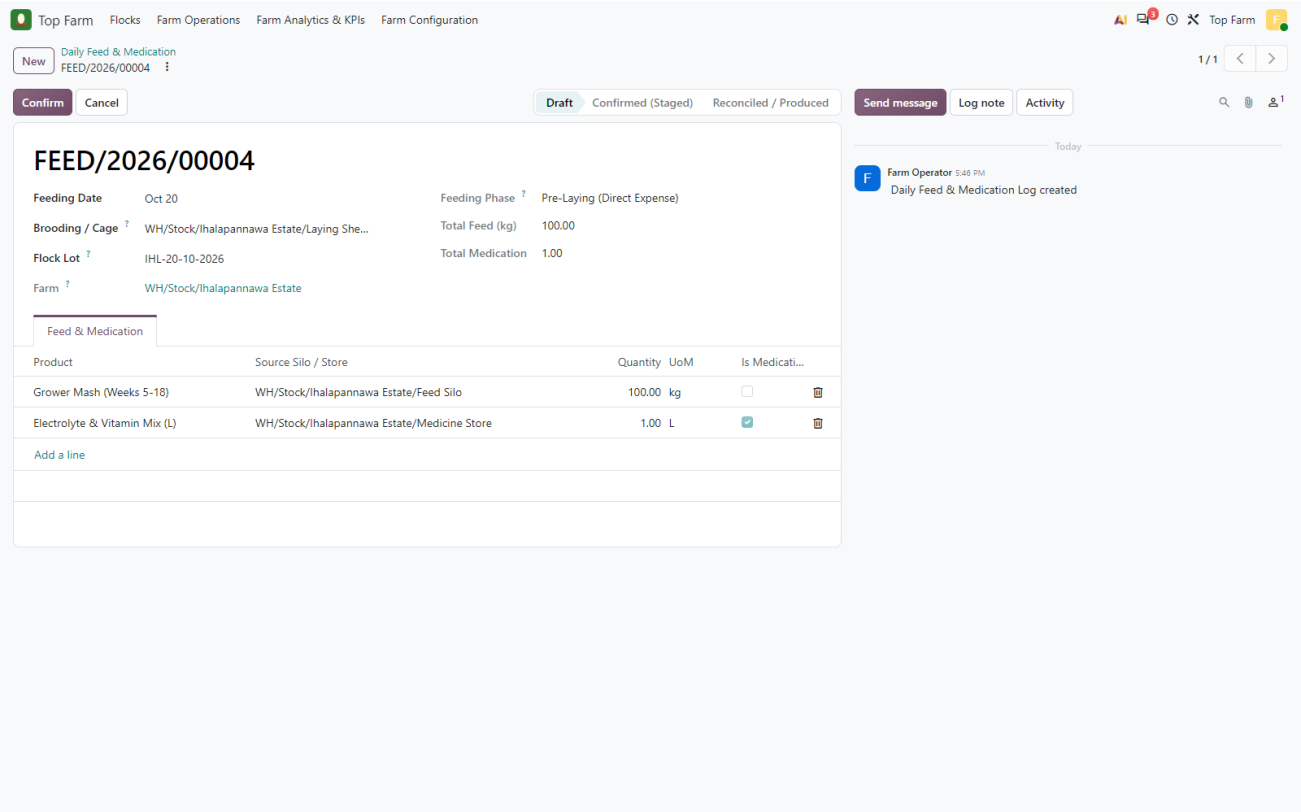

Figure 54. Rearing feed log FEED/2026/00004 in Cage A-01 of Laying Shed A: the flock IHL-20-10-2026 is filled in from the cage. Grower Mash 100 kg and Electrolyte & Vitamin Mix 1 L.

Figure 55: Confirmed

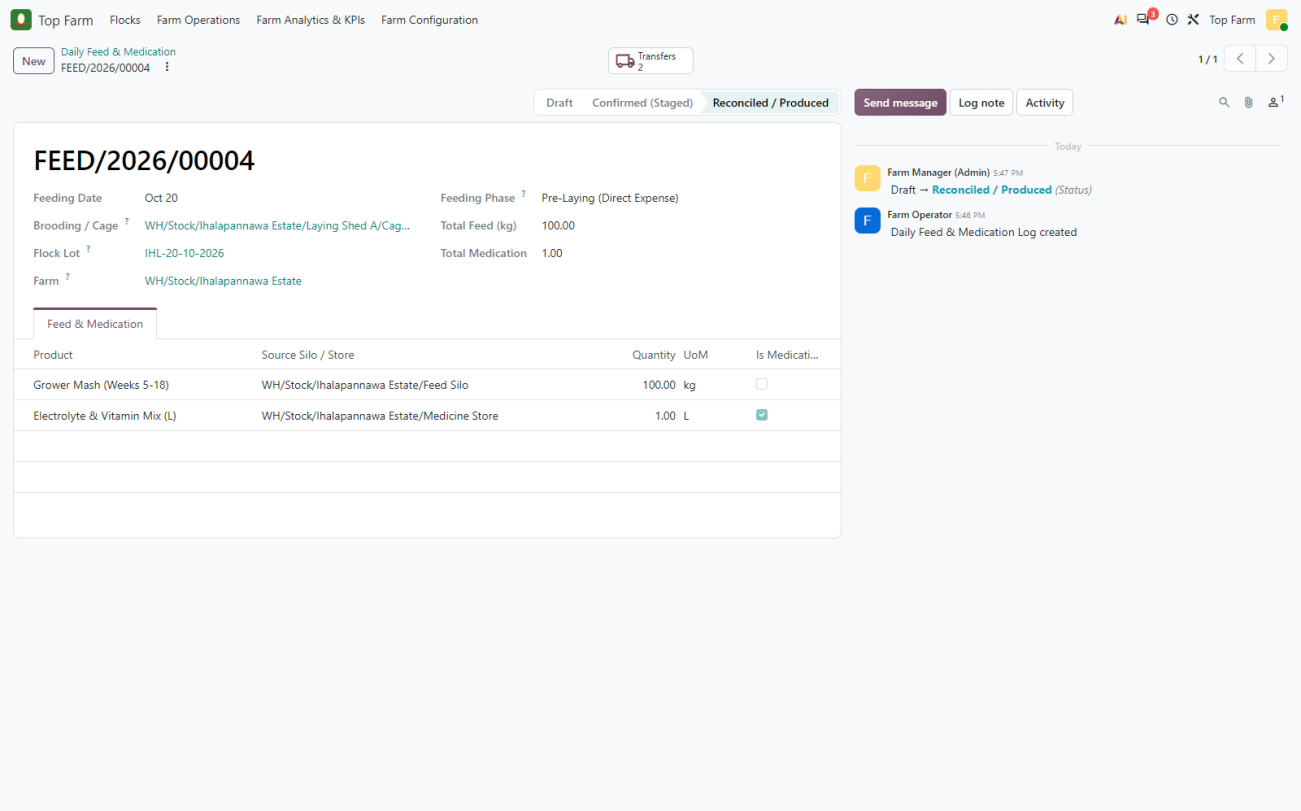

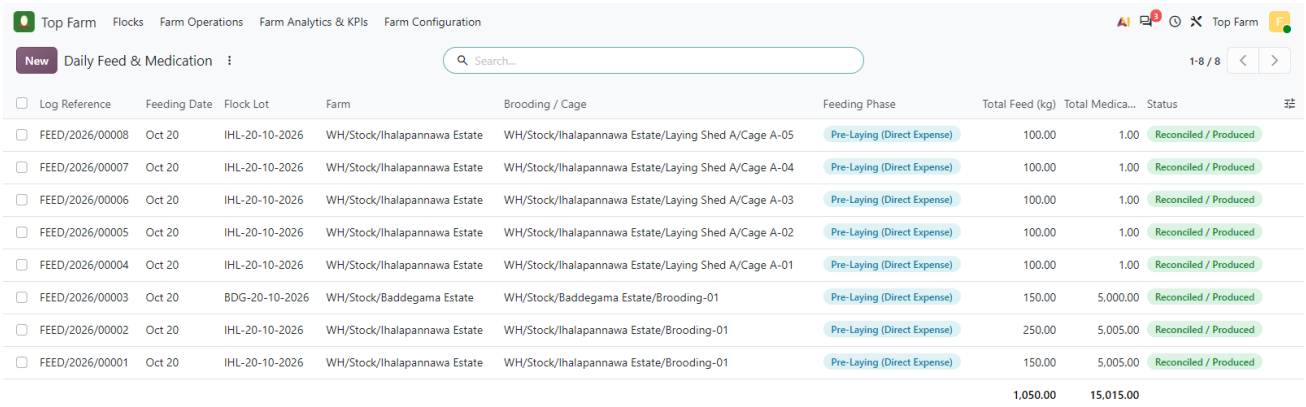

Figure 55. Confirmed: pre-laying feed is still a direct expense of the flock (Pre-Laying, Reconciled), now also charged to the cage.

Starter Crumbs (Weeks 0-4)	-56,000.00 Rs
None	-245,000.00 Rs

Figure 60. Analytic costs of the flock so far by cage (LKR 747,200; the LKR 750,000 chick purchase is in the bird stock value, not in analytic items). "None" = brooding and flock-level costs (LKR 676,500: vaccines, electrolytes, brooding mortality, starter feed, LPG heating, debeaking labour); one row per cage for the rearing grower feed, vitamins and cage mortality (LKR 70,700).

Figure 61: Pre-Laying Flock Investment during rearing

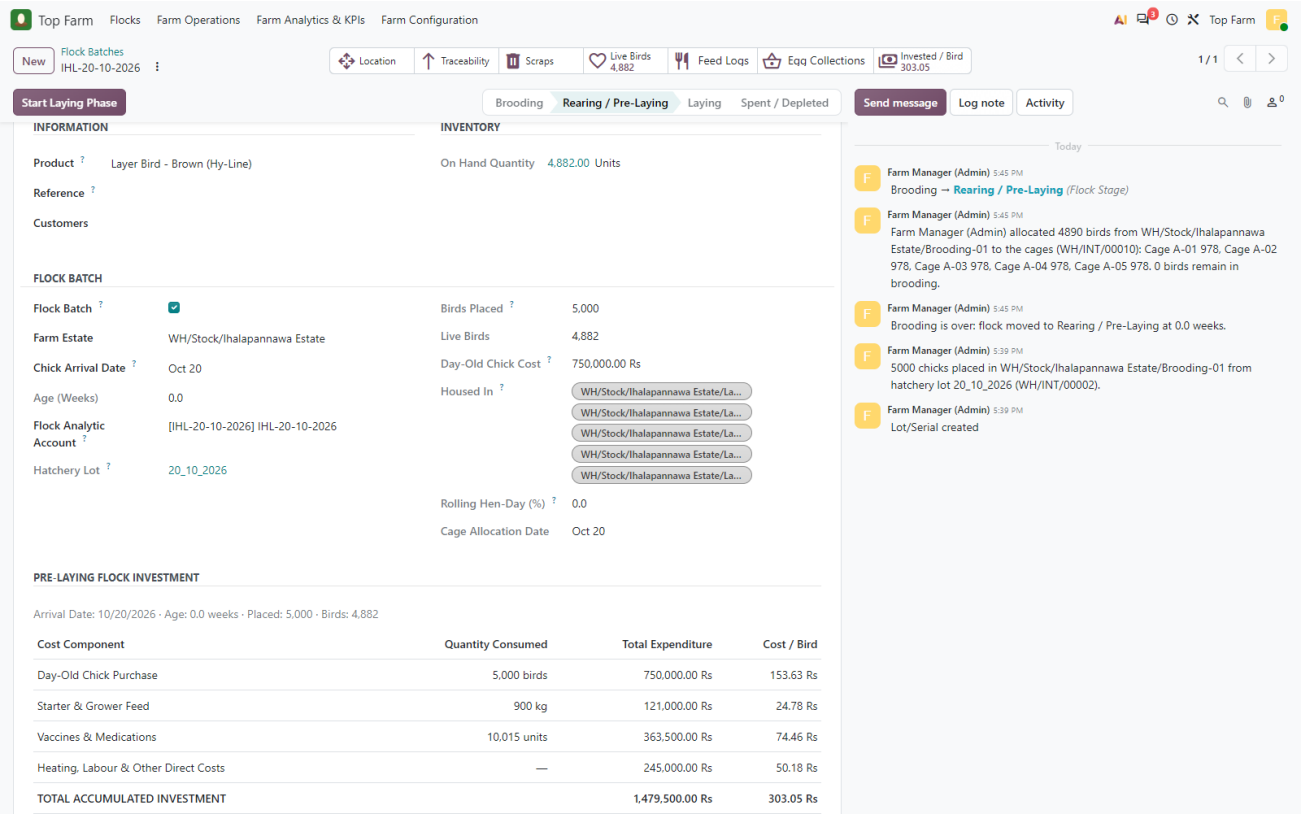

Figure 61. Pre-Laying Flock Investment during rearing: chicks, starter and grower feed, vaccines and vitamins, LPG heating and debeaking labour = LKR 1,479,500, i.e. LKR 303.05 per live bird (4,882), against the LKR 1,200-1,300 per bird benchmark. (Still dated on the test day, before the flock age is simulated.)

Figure 62: Pre-Laying Flock Investment report

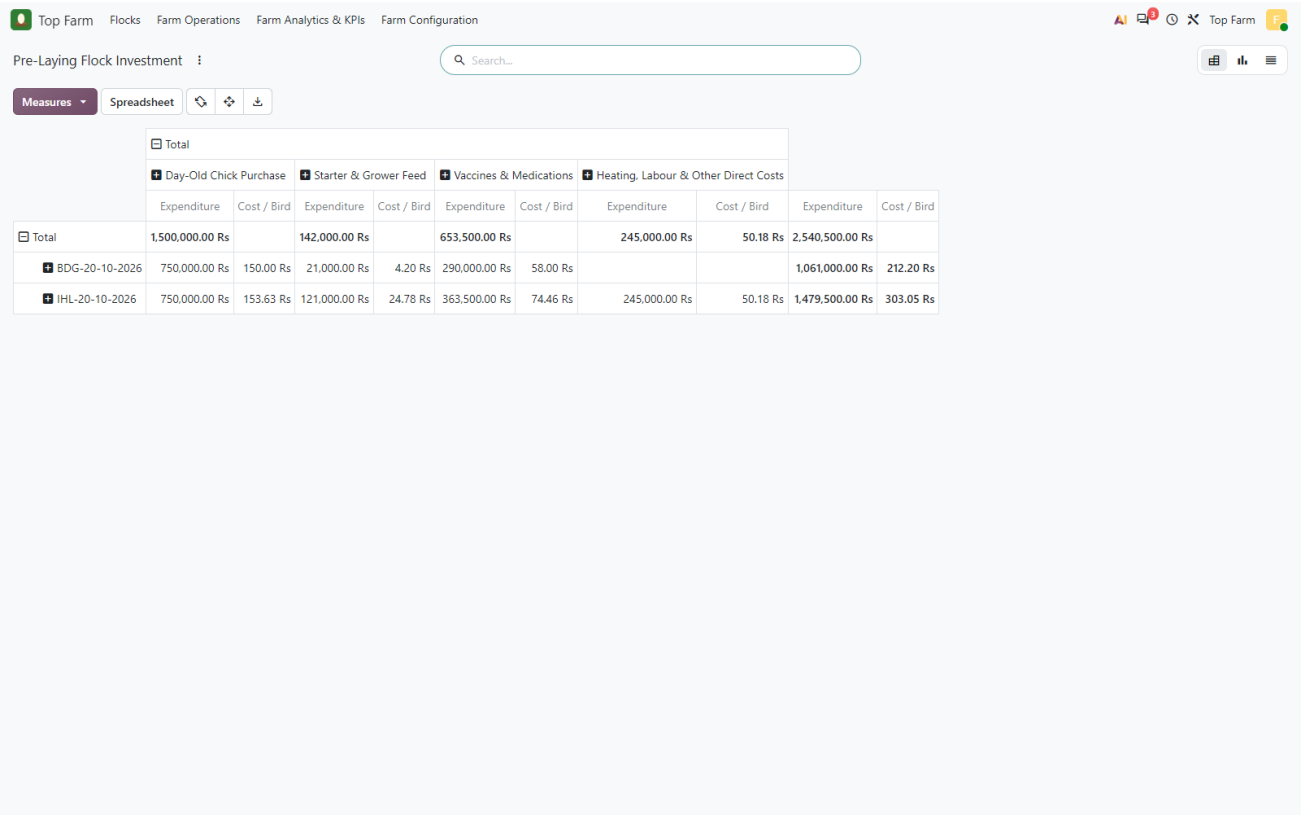

Figure 62. Pre-Laying Flock Investment report: expenditure and cost per bird by flock and cost component. Cost / Bird is meaningful on the flock rows; in the Total row it is only shown where a single flock has that cost.

9. Point of lay: the 50 % hen-day transition

The Laying Phase is never forced by the calendar. Each egg collection of a rearing flock older than 17 weeks recomputes its **rolling 7-day hen-day rate** (eggs over live bird days of its cages; a cage-day without a harvest counts its birds with no eggs). When the rate reaches 50 % the Farm Managers get a chatter alert and a To-Do; in manual mode a manager confirms with Start Laying Phase, which locks the pre-laying investment.

Date	Eggs	Bird snapshot	Daily hen-day %	Feed in MOs (kg)	Rolling 7-day %
2026-10-13	1,500	4,882	30.73	0.00	4.39
2026-10-14	1,500	4,882	30.73	0.00	8.78
2026-10-15	1,500	4,882	30.73	0.00	13.17
2026-10-16	4,000	4,882	81.93	0.00	24.87
2026-10-17	4,000	4,882	81.93	0.00	36.58
2026-10-18	4,000	4,882	81.93	0.00	48.28
2026-10-19	4,000	4,882	81.93	0.00	59.99
2026-10-20	4,390	4,882	89.92	550.00	68.44

13-19 October: pre-laying harvests (no staged feed, no feed component in the MOs). The rolling column is the rate at the end of each day, all cages harvested. On 19 October the alert was raised as soon as the Cage A-01 harvest was produced, at 50.6 % (the other four cages counted with no eggs yet); with all five cages the day ends at 59.99 %. 20 October: first laying day, the feed is consumed by the egg MOs.

Figure 63: Flock IHL-20-10-2026 at 18 weeks (simulated arrival 16 June)

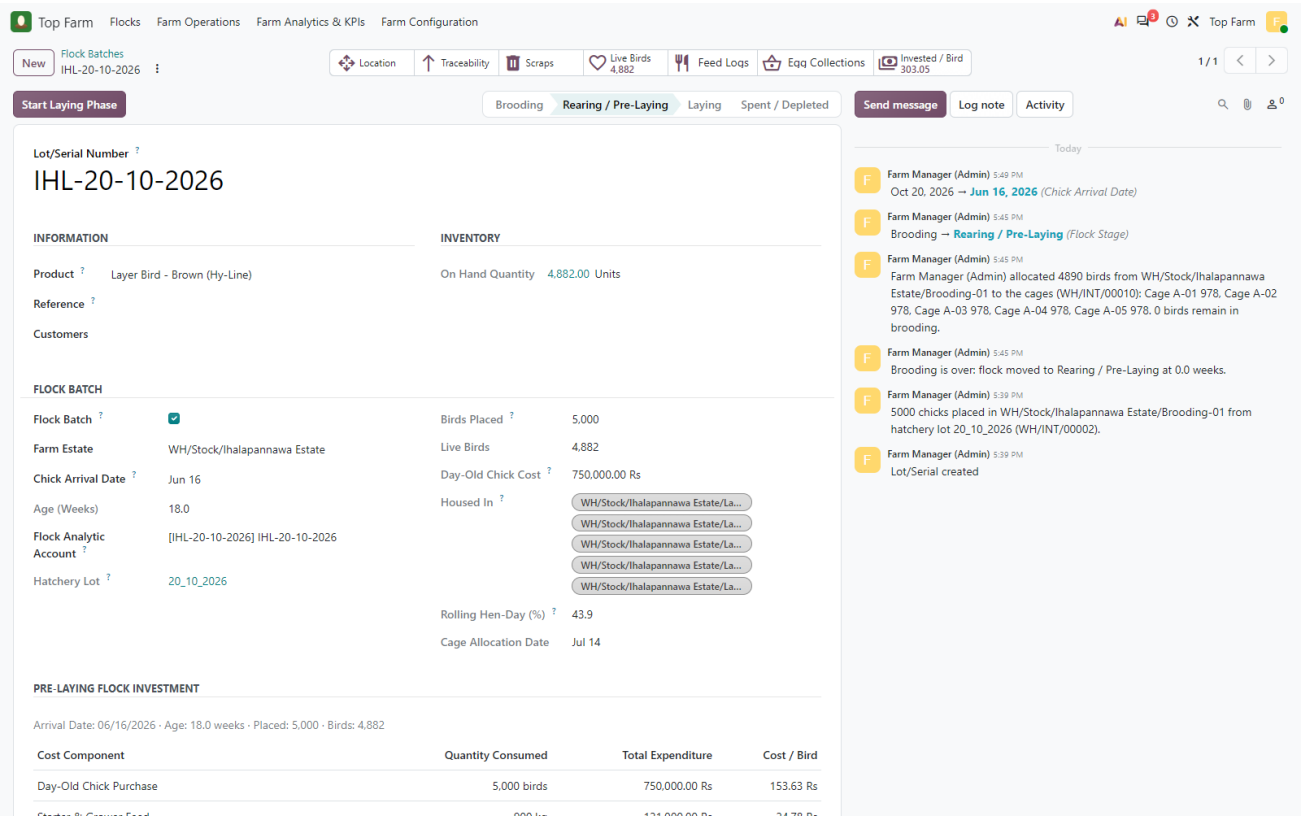

Figure 63. Flock IHL-20-10-2026 at 18 weeks (simulated arrival 16 June), still in Rearing / Pre-Laying. Its Rolling Hen-Day field counts the 7 days up to today, 20 October, with no harvest yet on 19-20 October; the 12-18 October rate is 48.28 %, below the 50 % benchmark. (The chatter's 'moved to Rearing / Pre-Laying at 0.0 weeks' was logged before the arrival date was moved back.)

Figure 64: First egg collections of the pre-laying flock

Figure 64. First egg collections of the pre-laying flock, 13-18 October (5 cages a day): about 31 % per cage on 13-15 October, then about 82 % on 16-18 October. The 19 October collection of Cage A-01 (top row) is still a draft.

Figure 65: Egg collection of Cage A-01 on 19 October

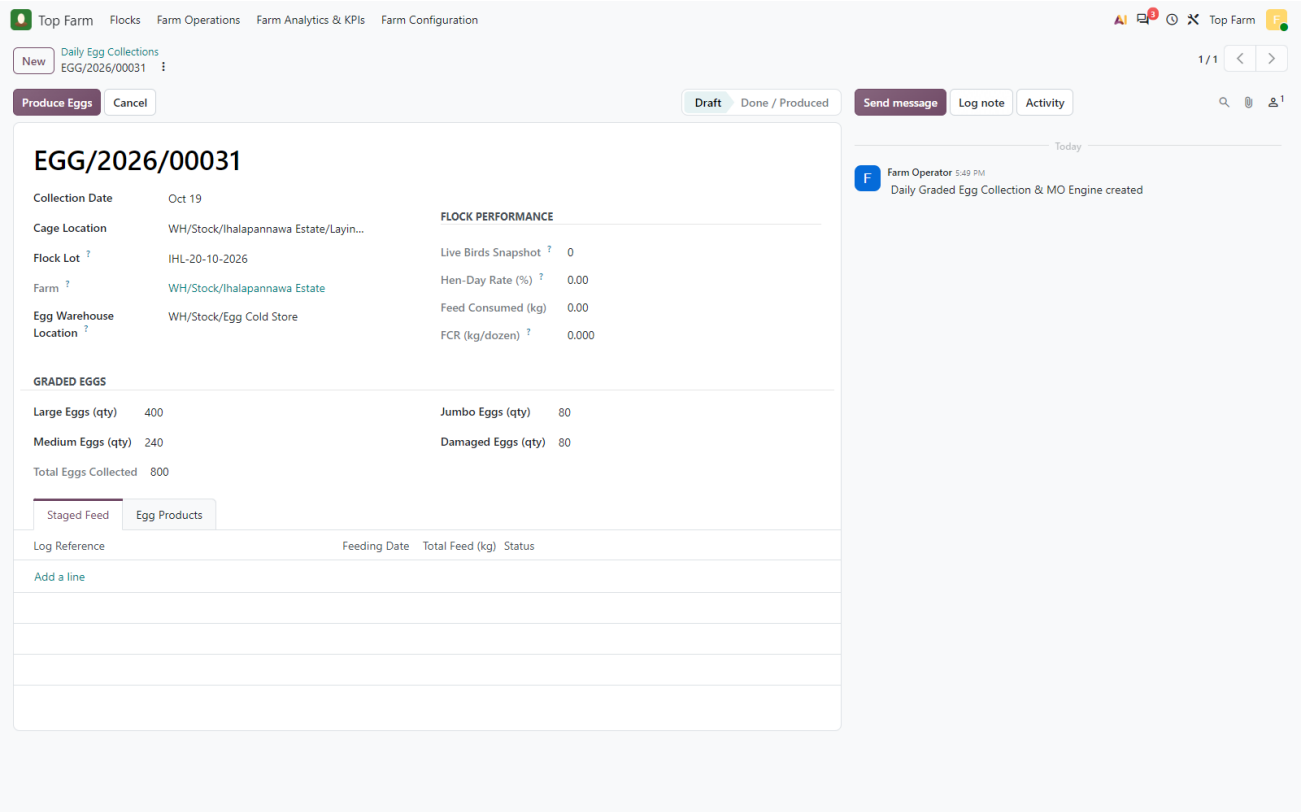

Figure 65. Egg collection of Cage A-01 on 19 October: 800 graded eggs (Large 400, Medium 240, Jumbo 80, Damaged 80). No staged feed: the flock is not laying yet, its feed is a direct expense.

Figure 66: Produced

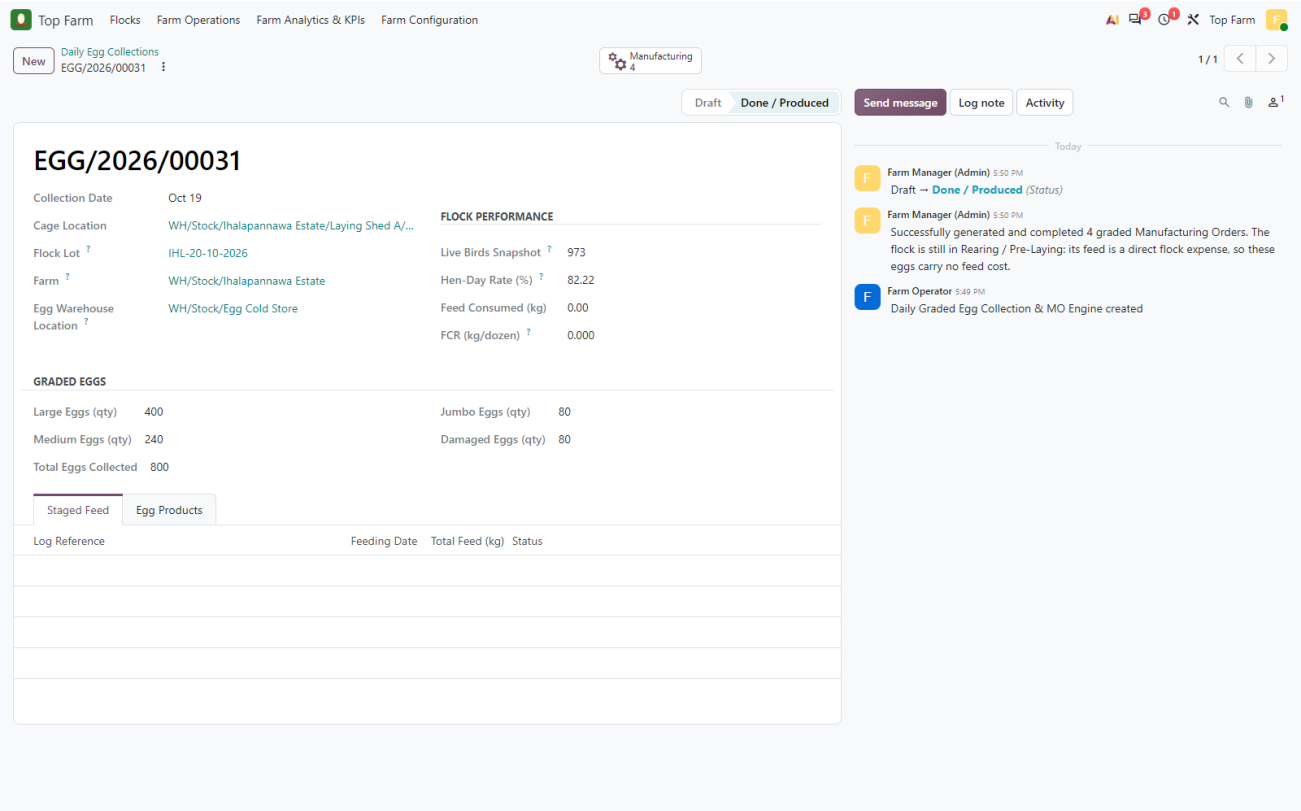

Figure 66. Produced: live birds snapshot 973 (Cage A-01), hen-day 82.22 %, one manufacturing order per egg grade lotted under the flock. The chatter notes that pre-laying eggs carry no feed cost.

Figure 67: The 4 graded manufacturing orders of the collection (Large 400, Medium 240

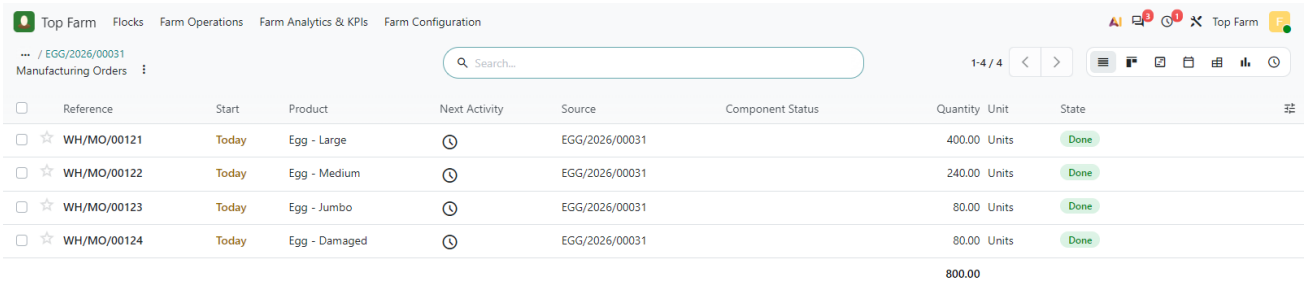

Figure 67. The 4 graded manufacturing orders of the collection (Large 400, Medium 240, Jumbo 80, Damaged 80).

Figure 68: Graded egg MO of a pre-laying flock

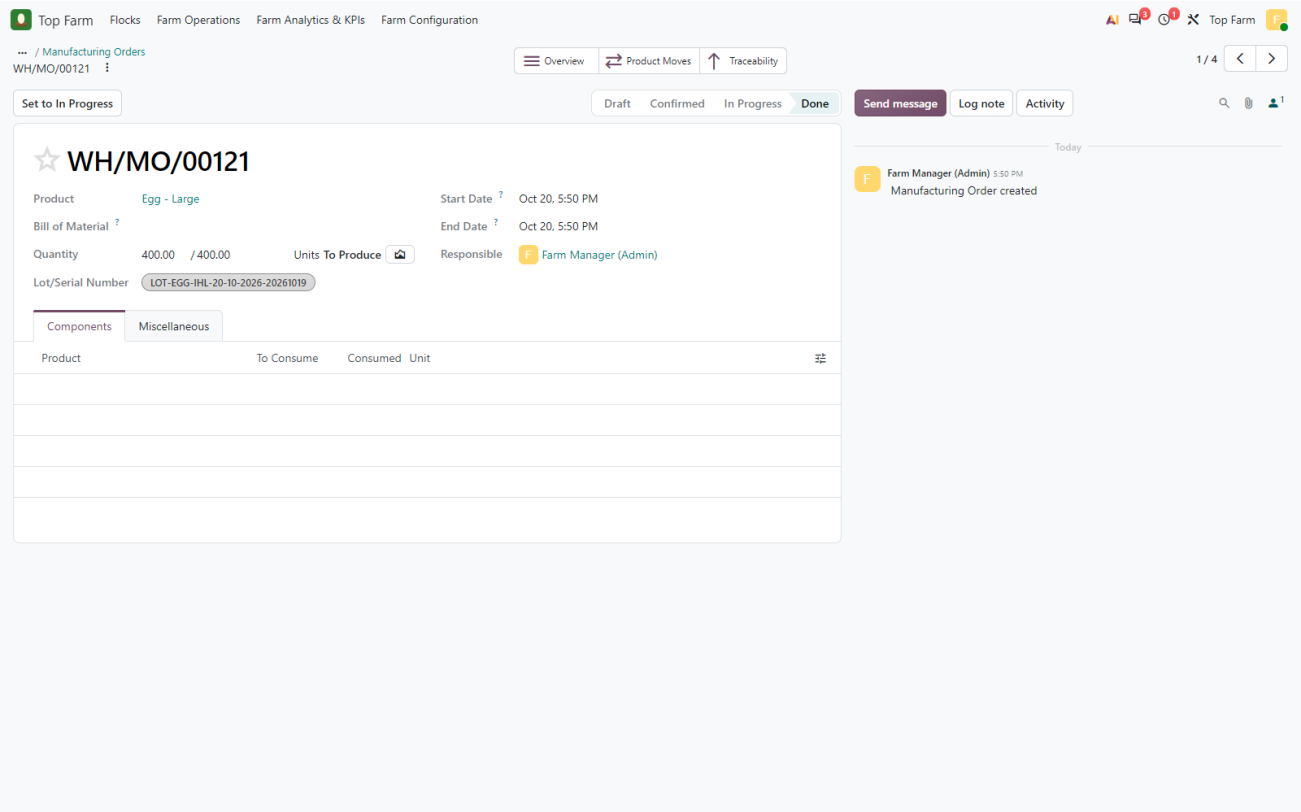

Figure 68. Graded egg MO of a pre-laying flock: no feed component; the eggs are produced under the egg lot LOT-EGG-IHL-20-10-2026-20261019. The MO dates show 20 October, the day the simulated collection was processed; the egg lot carries the collection date.

Figure 69: The Cage A-01 harvest of 19 October pushed the 7-day rolling hen-day ...

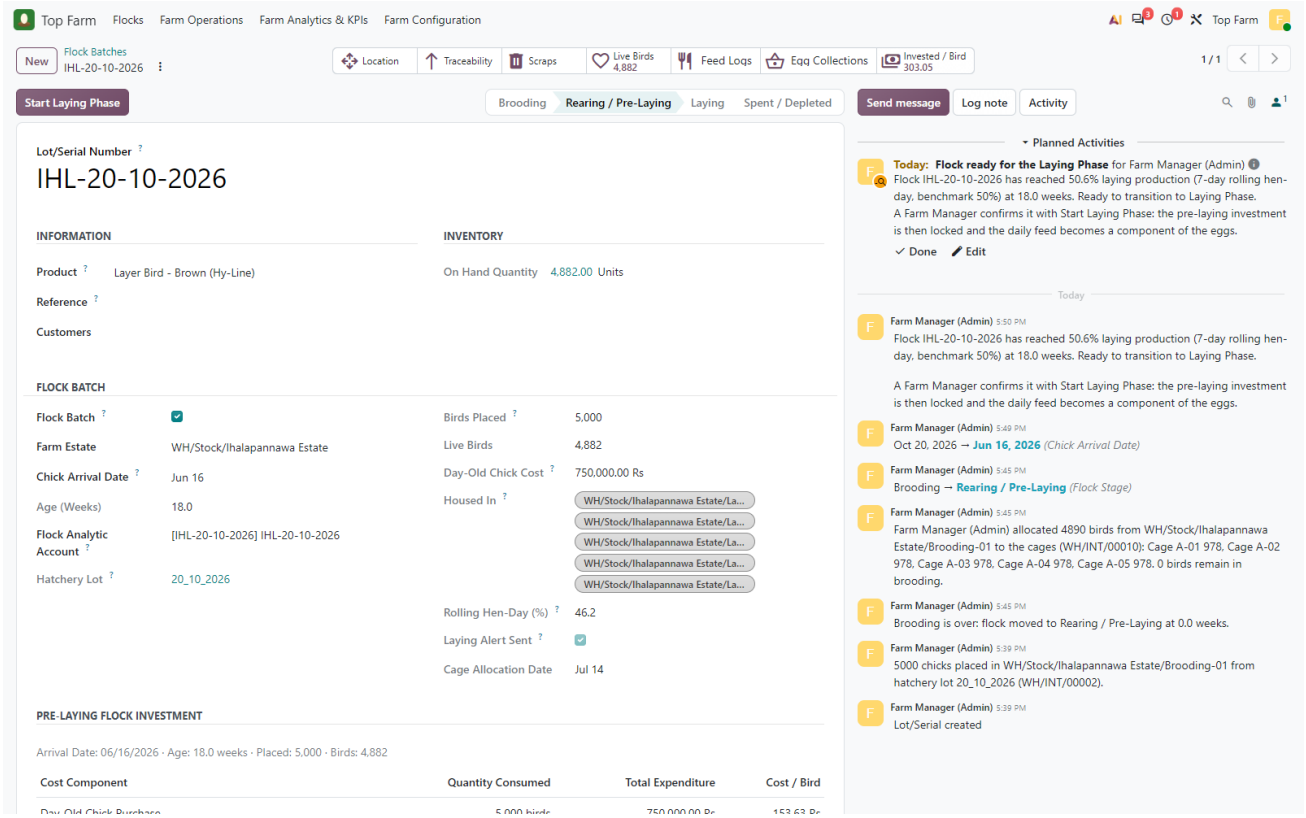

Figure 69. The Cage A-01 harvest of 19 October pushed the 7-day rolling hen-day rate of 13-19 October to 50.6 % (17,300 eggs / 34,174 live bird days, the other cages counted with no eggs yet): the Farm Manager gets the alert "Ready to transition to Laying Phase" and a To-Do. (The Rolling Hen-Day field counts up to today, 20 October.)

Figure 70: The Farm Manager clicks Start Laying Phase and confirms that the ...

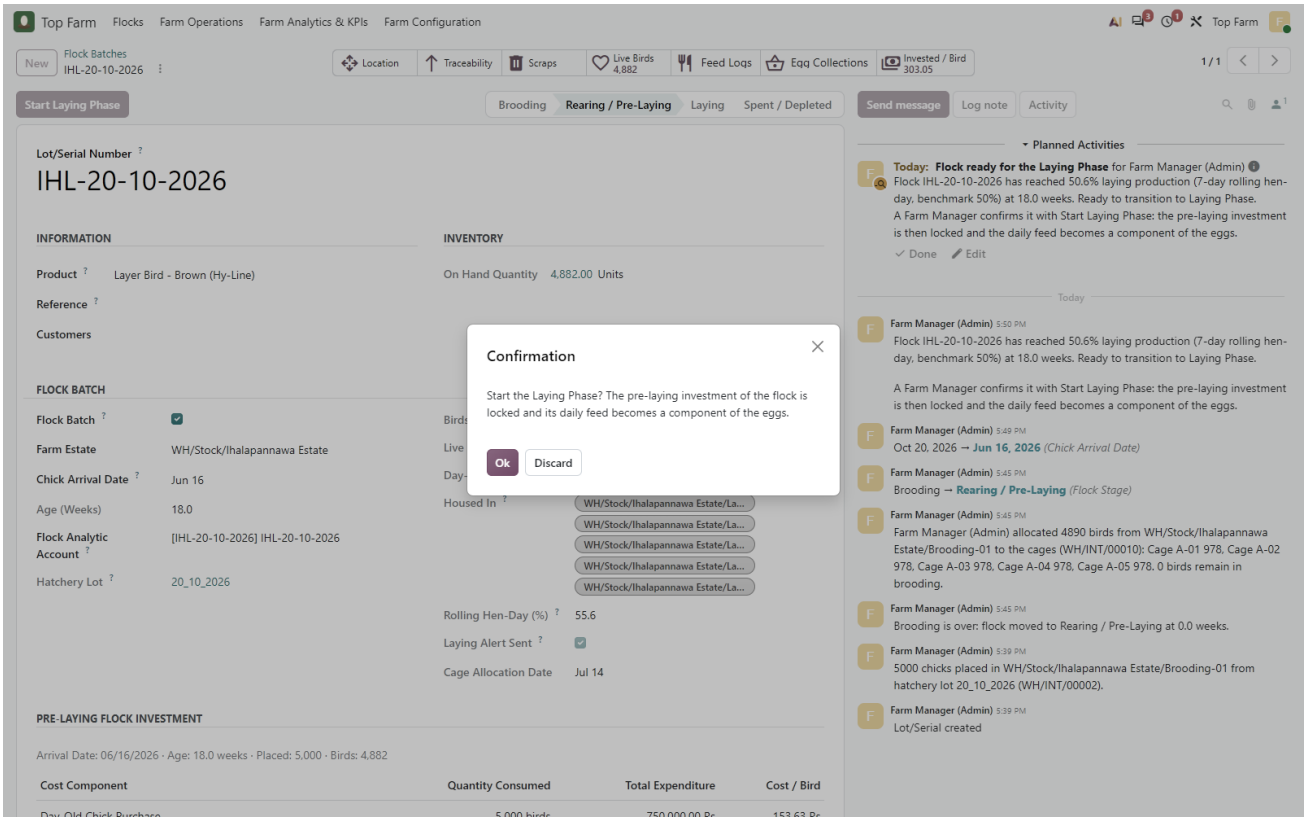

Figure 70. The Farm Manager clicks Start Laying Phase and confirms that the pre-laying investment will be locked. The 19 October collections of Cages A-02 to A-05 have been entered meanwhile (13-19 October: 59.99 % at the end of the day).

Figure 71: Flock IHL-20-10-2026 in Laying

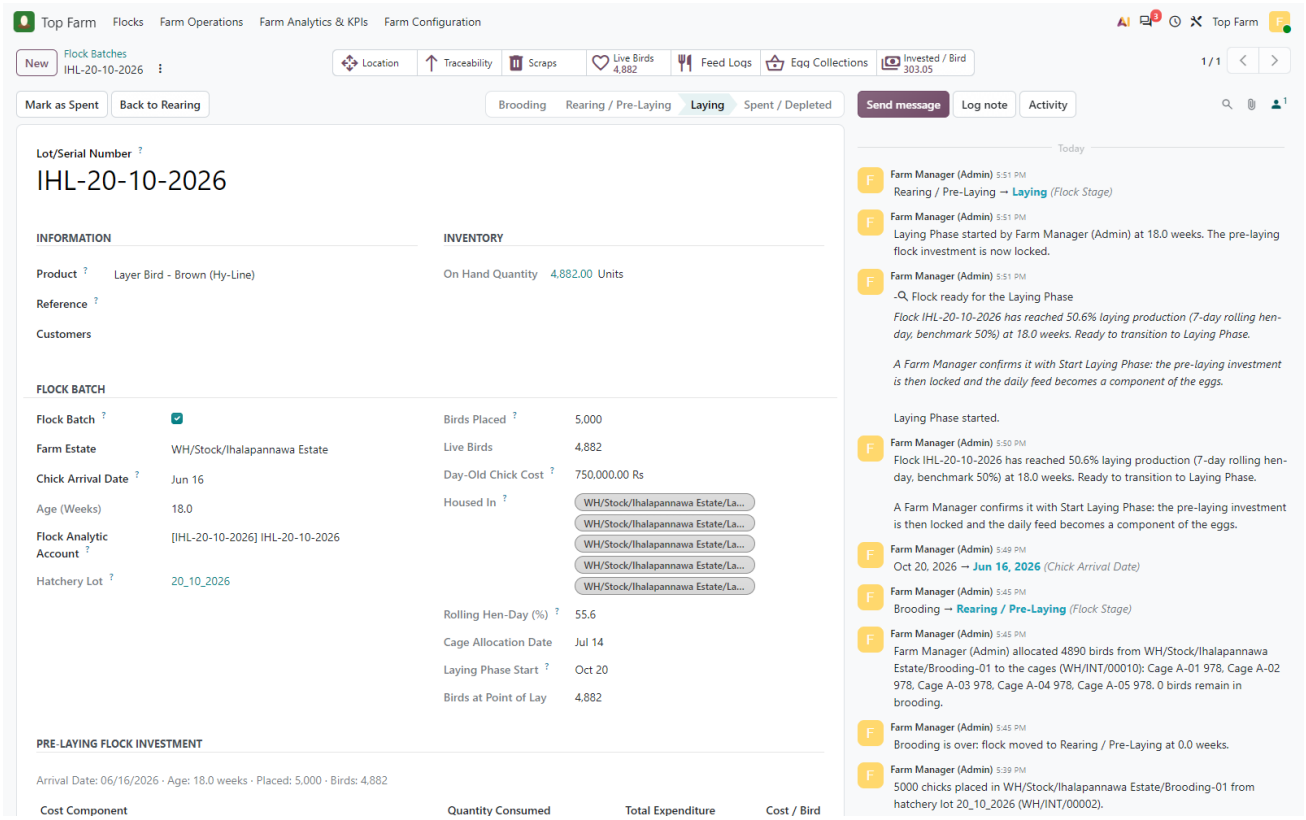

Figure 71. Flock IHL-20-10-2026 in Laying: Laying Phase start date and birds at point of lay recorded, the To-Do closed, the chatter logs the transition.

Figure 72: Pre-Laying Flock Investment locked at the start of the Laying Phase

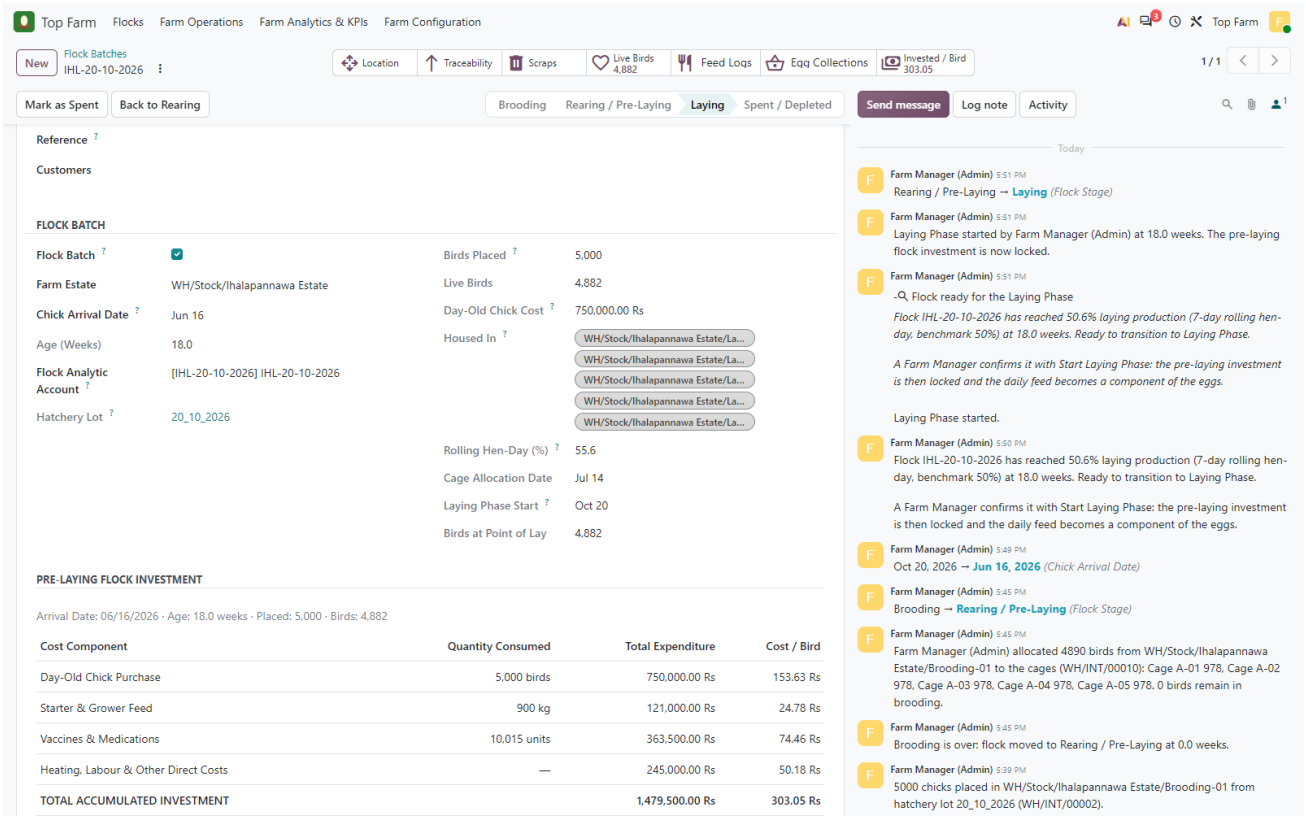

Figure 72. Pre-Laying Flock Investment locked at the start of the Laying Phase: LKR 1,479,500 over the 4,882 birds at point of lay = LKR 303.05 per bird.

10. Laying: staged feed, egg collection and manufacturing orders

Once the flock is Laying, the day's cage feed is **staged** (no stock move) until the egg collection of that cage and day. Producing the collection creates one manufacturing order per egg grade; the staged feed becomes their component in proportion to the eggs of each grade, and the eggs are received into the Egg Cold Store under the daily flock egg lot **LOT-EGG-IHL-20-10-2026-<date>**, linked to its parent flock.

10.1 Laying feed per cage (analytic accounting)

Cage	Layer Mash (kg)	Expected (LKR)	Analytic actual (LKR)	Accounts	Result
Cage A-01	110.00	13,200.00	13,200.00	Flock + cage	PASS
Cage A-02	110.00	13,200.00	13,200.00	Flock + cage	PASS
Cage A-03	110.00	13,200.00	13,200.00	Flock + cage	PASS
Cage A-04	110.00	13,200.00	13,200.00	Flock + cage	PASS
Cage A-05	110.00	13,200.00	13,200.00	Flock + cage	PASS

10.2 Egg balance

Grade	Collected	Produced by MOs	Sold	On hand	Result
Large	12,490	12,490	3,000	9,490	PASS
Medium	7,650	7,650	2,000	5,650	PASS
Jumbo	2,550	2,550	600	1,950	PASS
Damaged	2,200	2,200	200	2,000	PASS

Figure 73: Laying feed log in Cage A-01 (20 October)

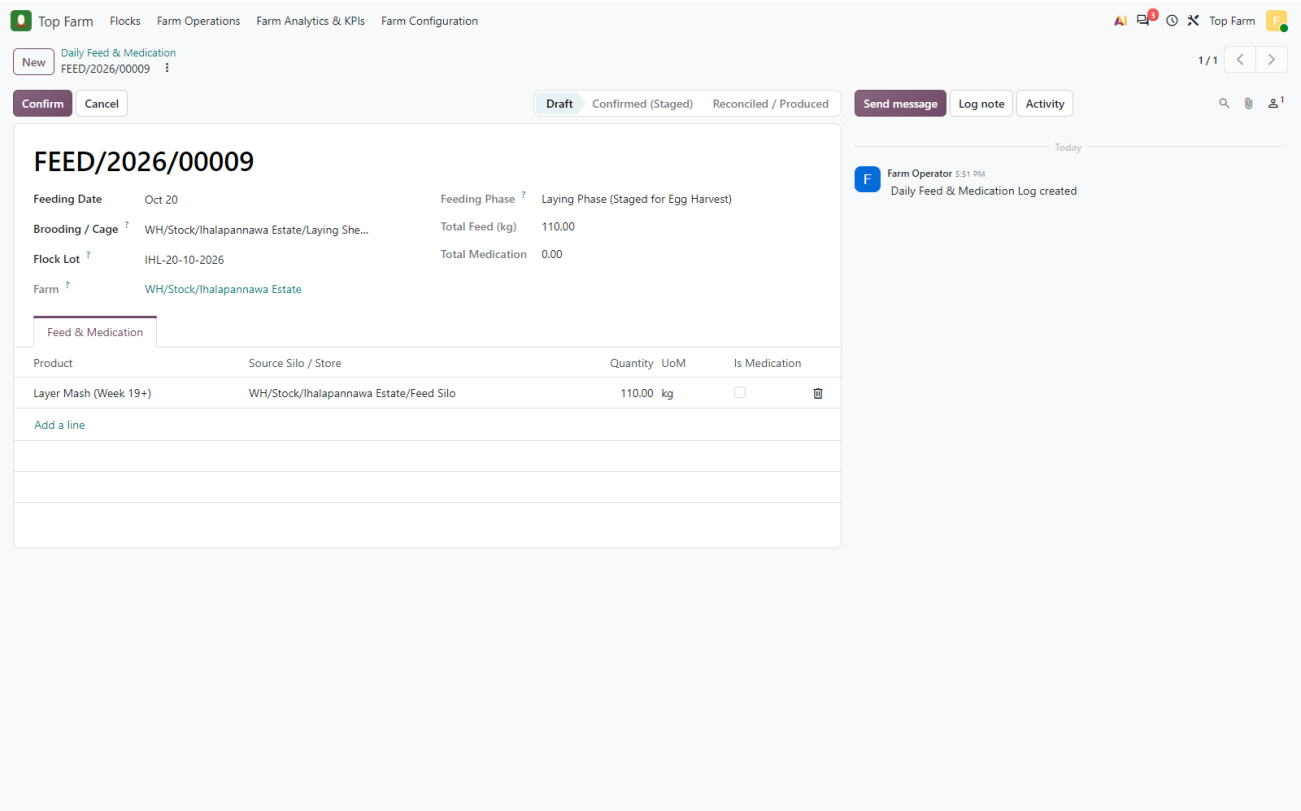

Figure 73. Laying feed log in Cage A-01 (20 October): Layer Mash 110 kg. The flock is Laying, so the Feeding Phase is "Laying Phase (Staged for Egg Harvest)".

Figure 74: Confirmed (Staged)

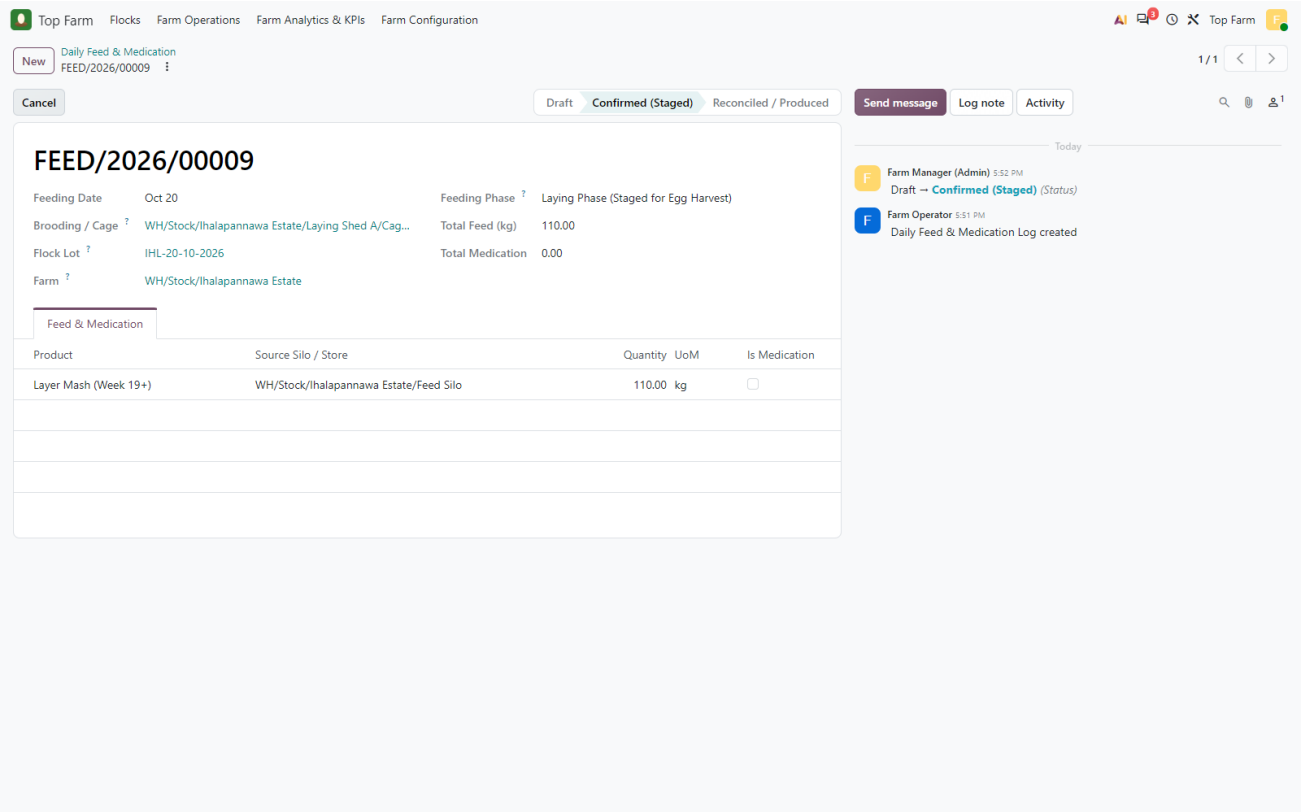

Figure 74. Confirmed (Staged): no stock moves yet. The feed waits for the day's egg collection, which consumes it in the egg MOs.

Figure 75: Egg collection of Cage A-01 on 20 October

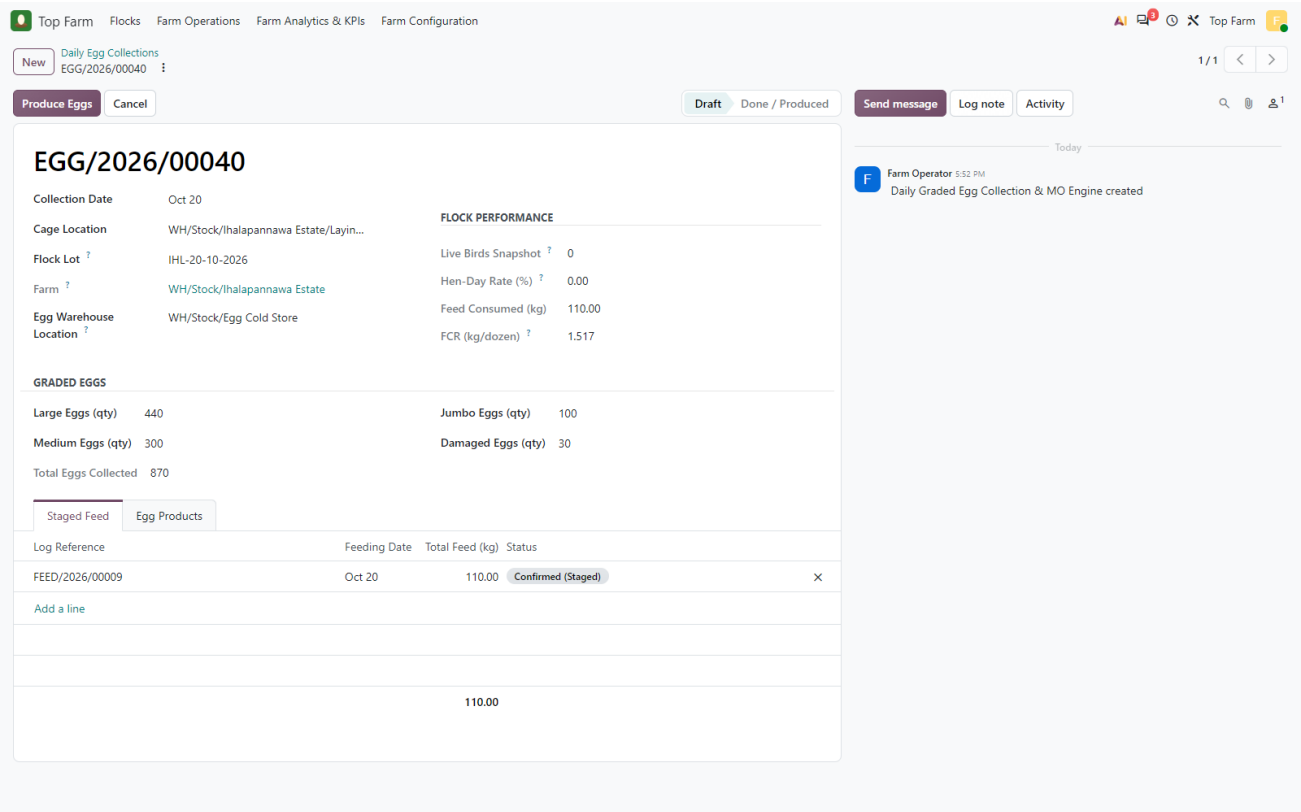

Figure 75. Egg collection of Cage A-01 on 20 October: 870 graded eggs (Large 440, Medium 300, Jumbo 100, Damaged 30); the Staged Feed tab holds the 110 kg Layer Mash log.

Figure 76: Produced

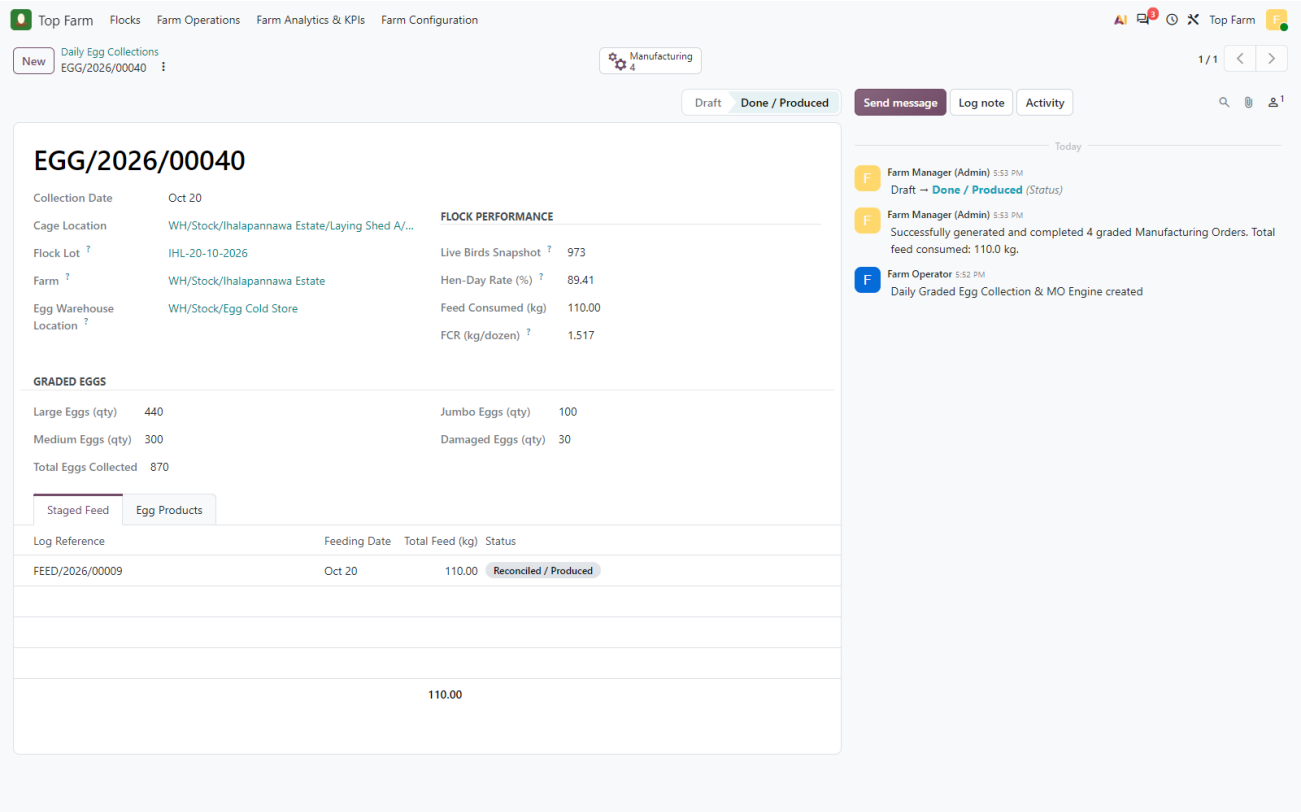

Figure 76. Produced: live birds snapshot, hen-day rate and FCR (kg feed per dozen eggs) recorded; 4 graded MOs consumed the 110 kg in proportion to the eggs.

Figure 77: The 4 graded MOs of the collection

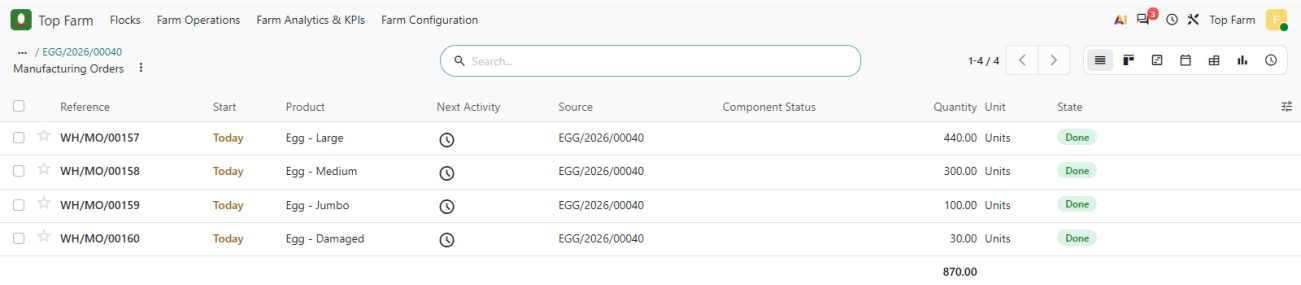

Figure 77. The 4 graded MOs of the collection.

Figure 78: Large-egg MO

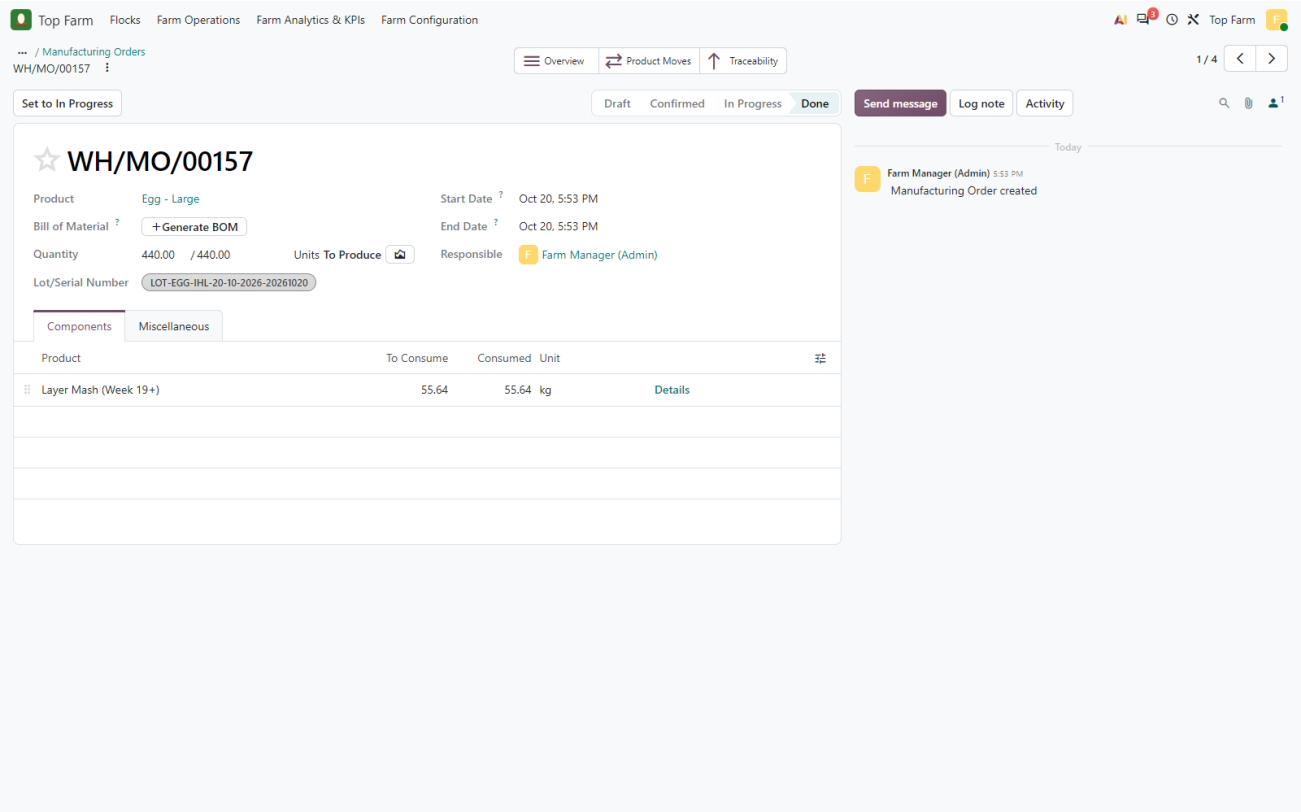

Figure 78. Large-egg MO: 55.64 kg of Layer Mash consumed as a component, in proportion to the large eggs (440 / 870 x 110 kg = 55.63 kg; the 0.01 kg rounding remainder goes to the largest grade so that the 4 MOs consume exactly 110 kg); finished eggs under lot LOT-EGG-IHL-20-10-2026-20261020.

Figure 79: Egg lot LOT-EGG-IHL-20-10-2026-20261020 (Large)

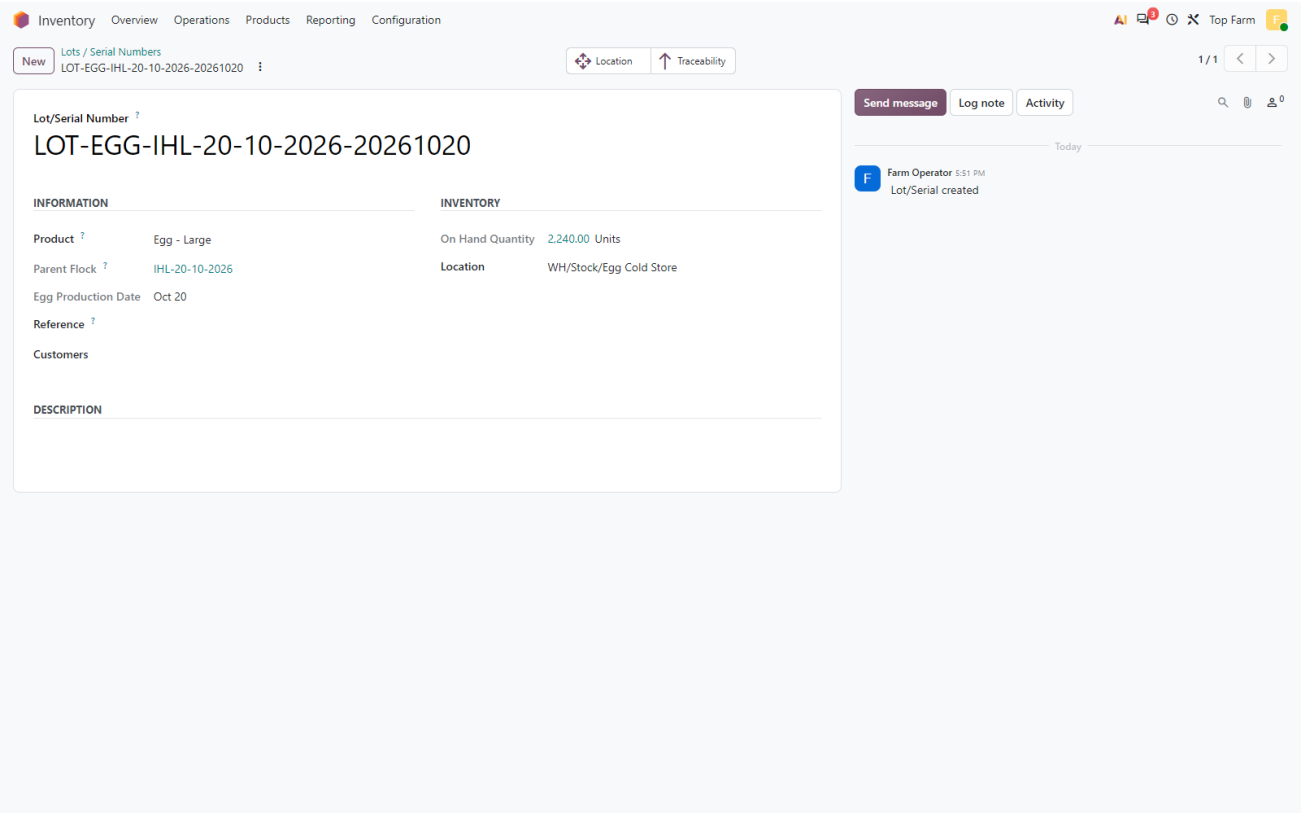

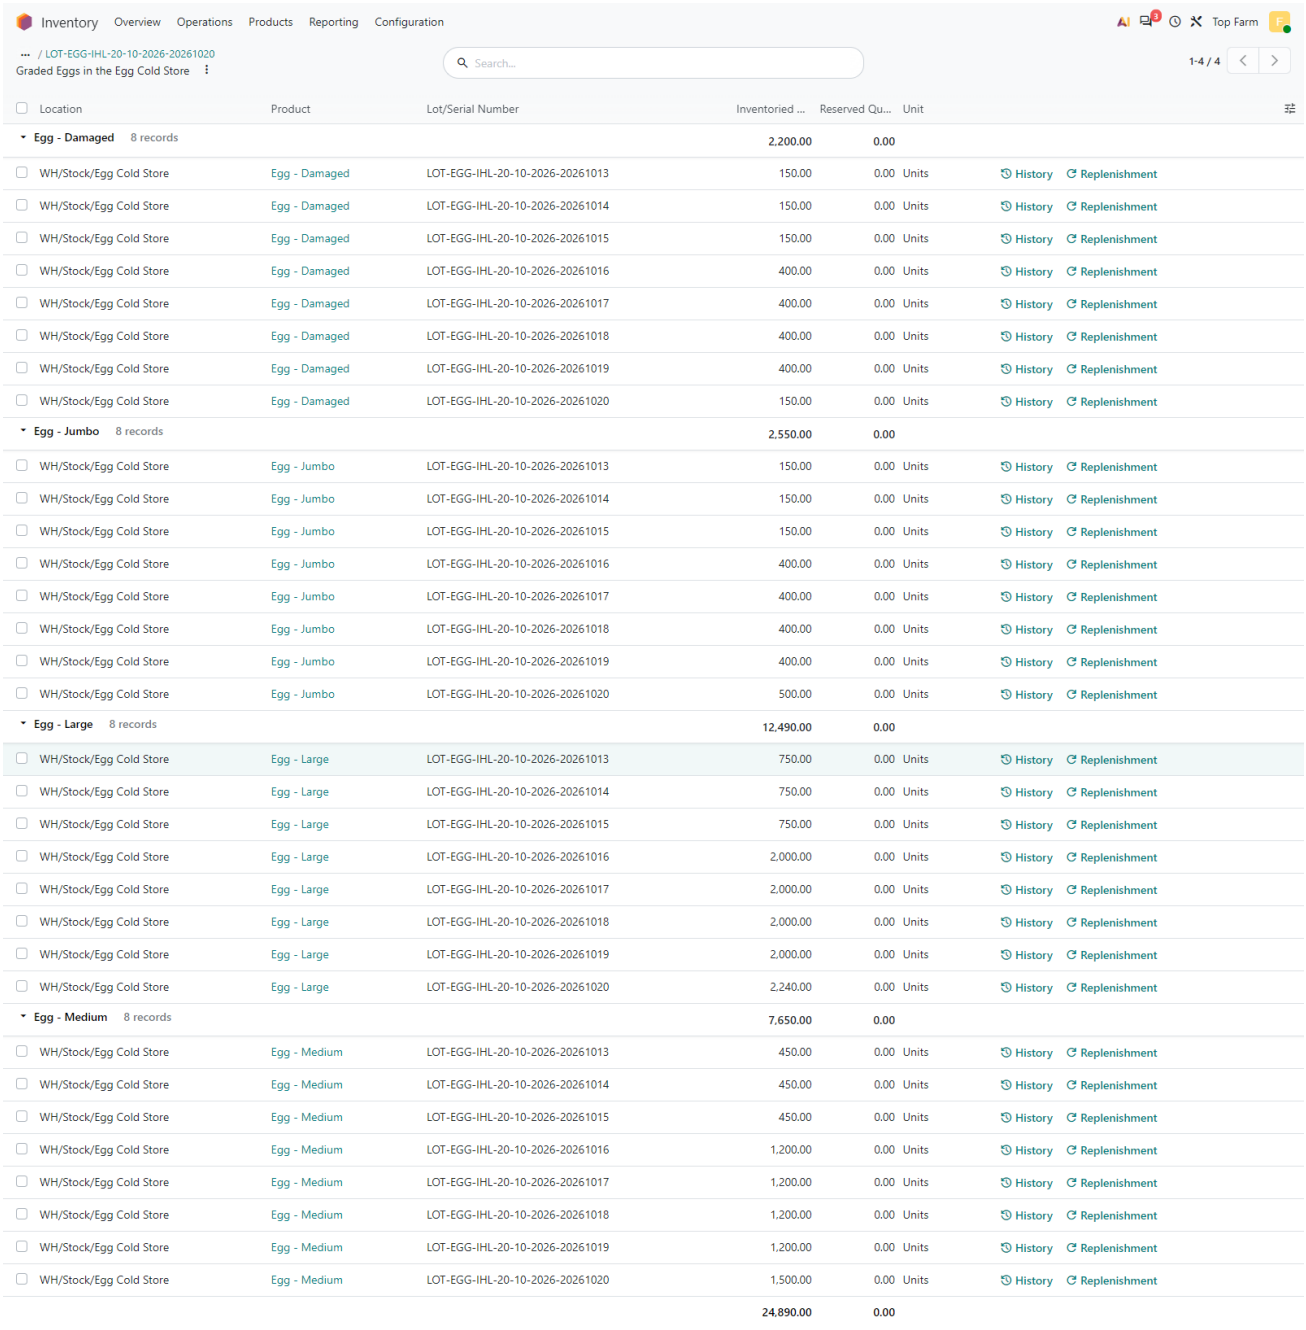

Figure 79. Egg lot LOT-EGG-IHL-20-10-2026-20261020 (Large): Parent Flock IHL-20-10-2026 and Egg Production Date, used to trace sales back to the flock.

Figure 82. Egg Production Analysis by flock and cage, per grade: 24,890 eggs on 13-20 October. The Hen-Day (%) under a grade is the flock rate weighted by the share of the eggs of that grade, not a per-grade laying rate; the overall rate is 63.73 %.

11. Sales: eggs and spent hens

The eggs are sold from the Egg Cold Store; the delivery takes the oldest flock egg lots first. When the delivery is validated, each sale line receives the analytic distribution of the flock(s) of the delivered lots (here 100 % IHL-20-10-2026), and the invoice lines inherit it. At the end of the cycle (simulated) the spent hens are sold from the cages under the flock lot, the flock is marked Spent / Depleted and the permanent cages are free for the next flock.

Figure 83: Egg sale order confirmed

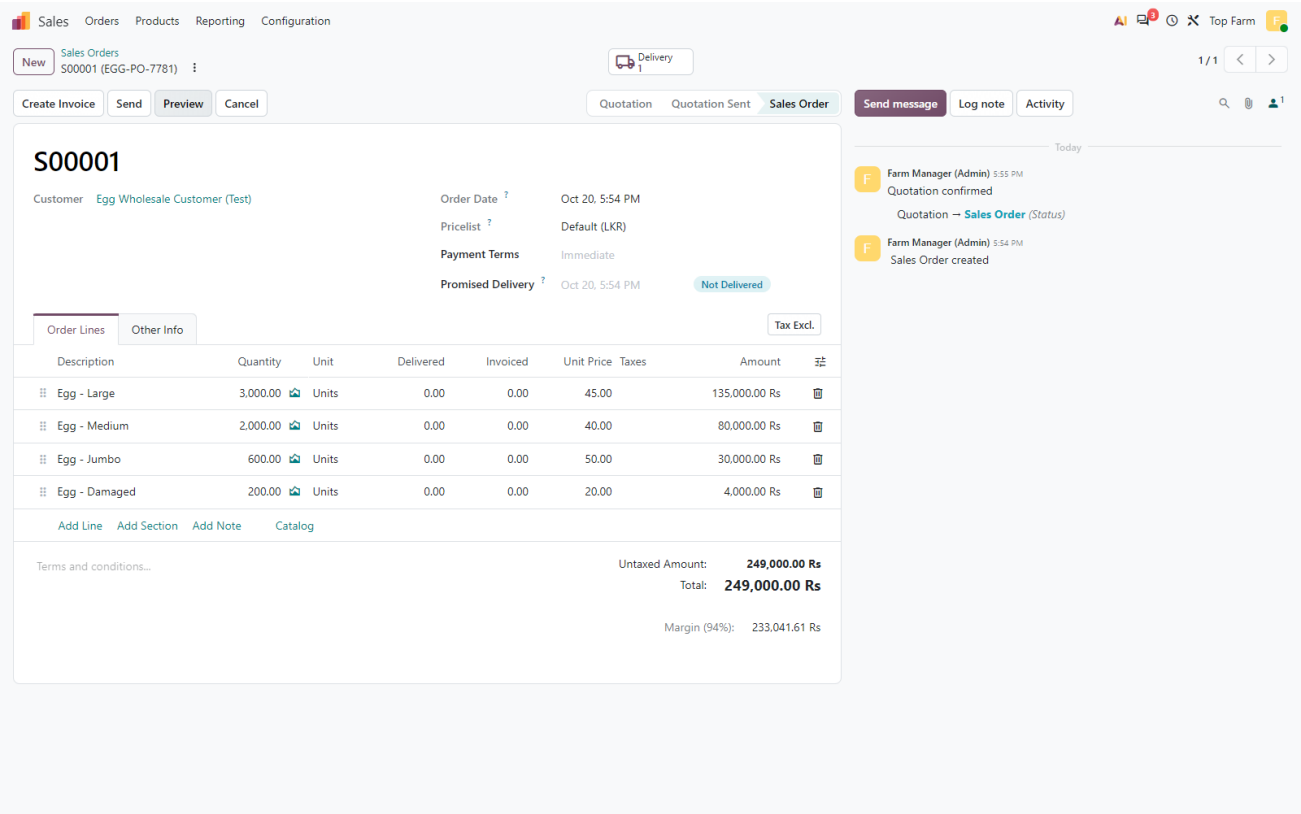

Figure 83. Egg sale order confirmed: Large 3,000 @ 45, Medium 2,000 @ 40, Jumbo 600 @ 50, Damaged 200 @ 20 (LKR 249,000).

12. Flock reports and financial reconciliation

12.1 Flock lifetime P&L

Line	Expected (LKR)	Flock Lifetime Profitability (LKR)	Result
Egg revenue	249,000.00	249,000.00	PASS
Spent hen revenue	3,173,300.00	3,173,300.00	PASS
Feed cost	187,000.00	187,000.00	PASS
Medication cost	363,500.00	363,500.00	PASS
Mortality loss	17,700.00	17,700.00	PASS
Bird cost of sales	732,300.00	732,300.00	PASS
Other direct cost	245,000.00	245,000.00	PASS
Total direct cost	**1,545,500.00**	**1,545,500.00**	PASS
Gross operating profit	**1,876,800.00**	**1,876,800.00**	PASS

Bird cost of sales is the standard cost of the spent hens delivered; with the mortality loss it adds up to the cost of every chick that left the flock.

12.2 General ledger

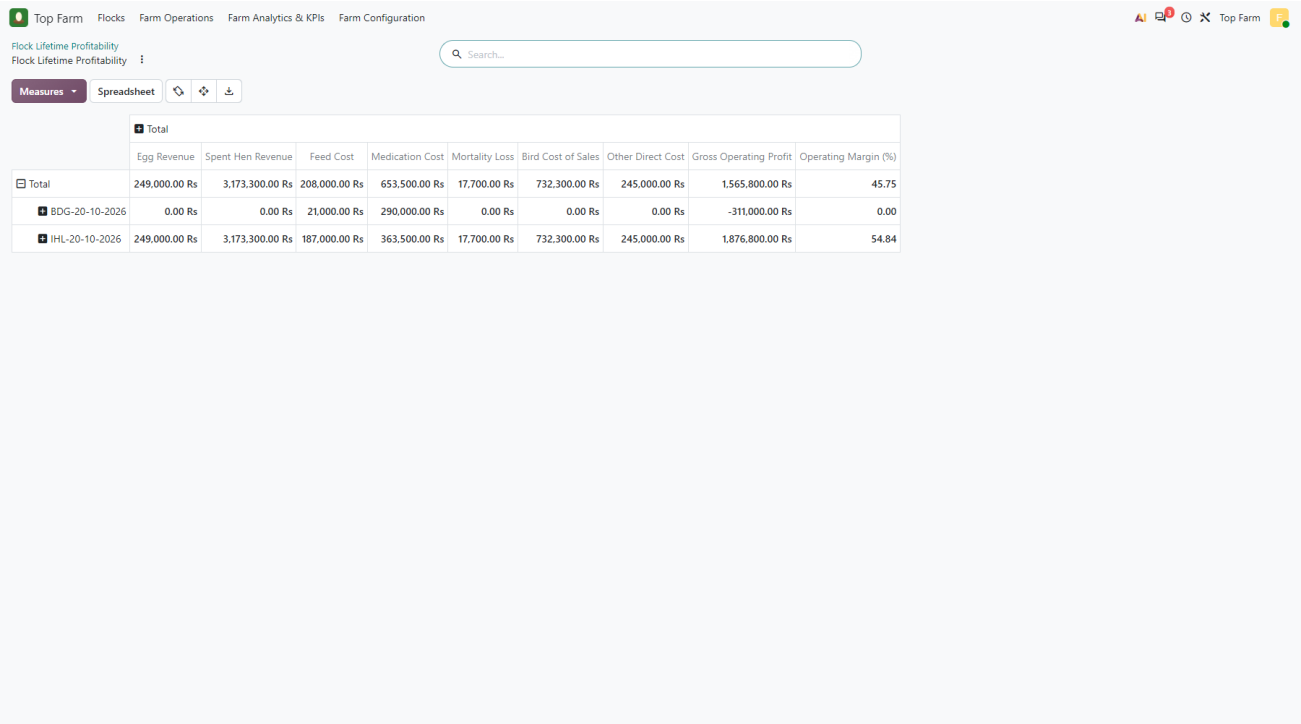

Account	What it holds	Expected (LKR)	Balance (LKR)	Result
510100 Feed Expense	Feed Expense (brooding + rearing, both estates)	142,000.00	142,000.00	PASS
510200 Vet & Medication Expense	Vet & Medication Expense	653,500.00	653,500.00	PASS
510300 Mortality Loss	Mortality Loss	17,700.00	17,700.00	PASS
510400 Brooding Heating (LPG / Electricity)	Brooding Heating (LPG / Electricity)	170,000.00	170,000.00	PASS
510500 Bird Care Labour (Debeaking)	Bird Care Labour (Debeaking)	75,000.00	75,000.00	PASS
410100 Egg Sales	Egg Sales (credit)	-249,000.00	-249,000.00	PASS
410200 Spent Hen Sales	Spent Hen Sales (credit)	-3,173,300.00	-3,173,300.00	PASS

Feed and medication expenses include the Baddegama flock (150 kg starter, 5,000 Marek's doses). The laying feed is not an expense: it passes through the production clearing account into the egg stock.

12.3 Dashboard figures (13-20 October, flock IHL-20-10-2026)

KPI	Value
Eggs harvested	24,890
Hen-day rate	63.73 %
FCR (kg feed per dozen eggs)	0.265
Feed consumed by egg MOs (kg)	550.00
Dead birds / mortality	118 / 1.696 %

Figure 100: All analytic items of flock IHL-20-10-2026 over its lifecycle

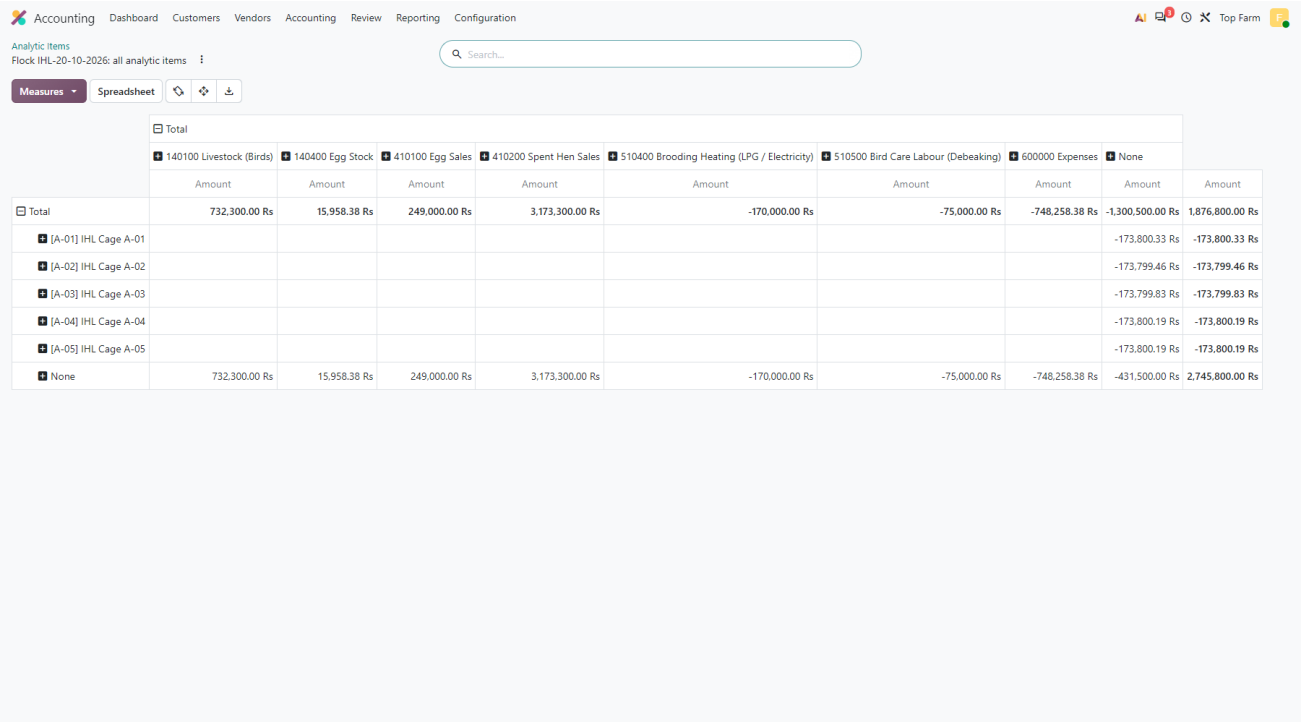

Figure 100. All analytic items of flock IHL-20-10-2026 over its lifecycle, by cage (rows; "None" = flock level) and general account (columns): sales income, the cost-of-goods-sold pairs of the invoices (Livestock / Egg Stock against 600000 Expenses, netting to zero), the bills, and the stock moves (no general account). The grand total, LKR 1,876,800, equals the gross operating profit of the flock P&L.

Figure 101: General ledger of the farm accounts

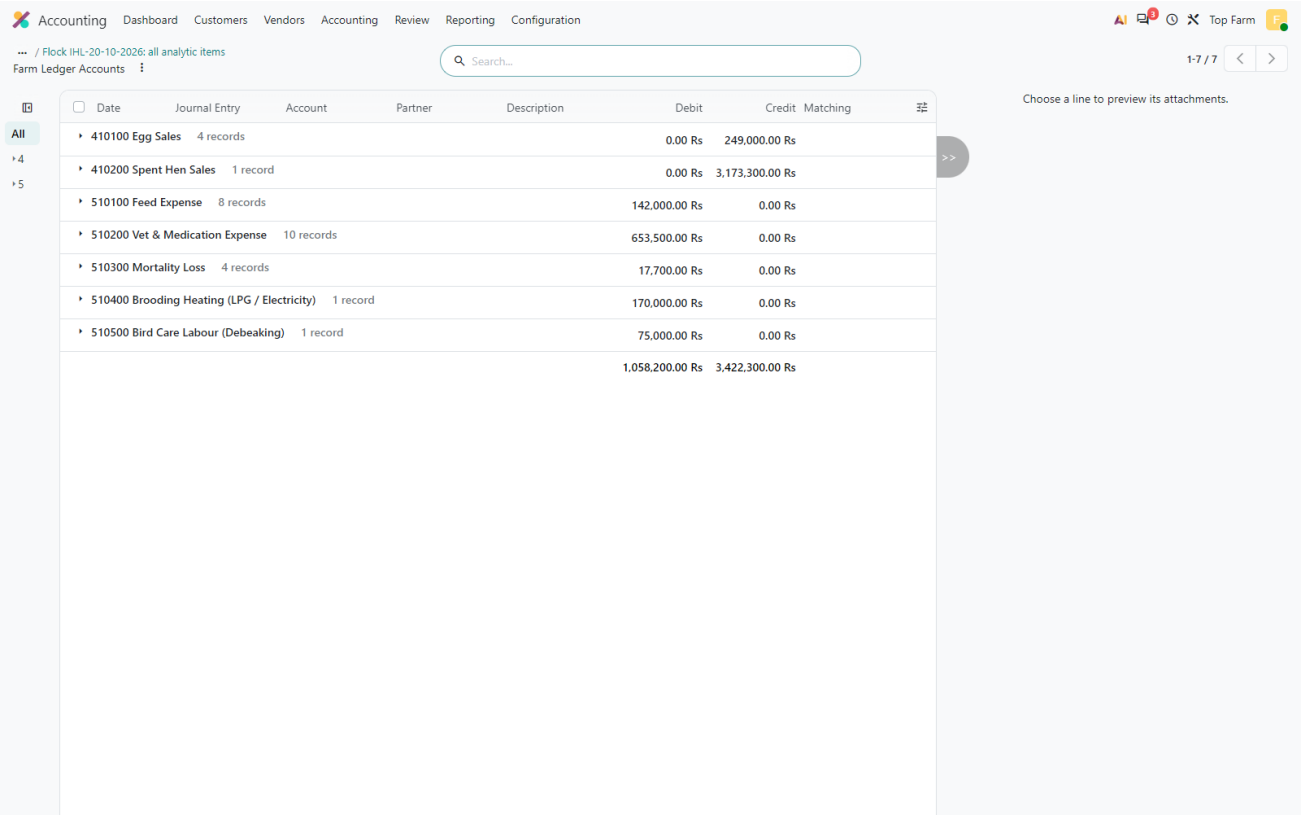

Figure 101. General ledger of the farm accounts: feed, medication, mortality, heating and labour expenses; egg and spent hen sales.

Figure 102: Flock Performance Dashboard, 13-20 October, all active flocks

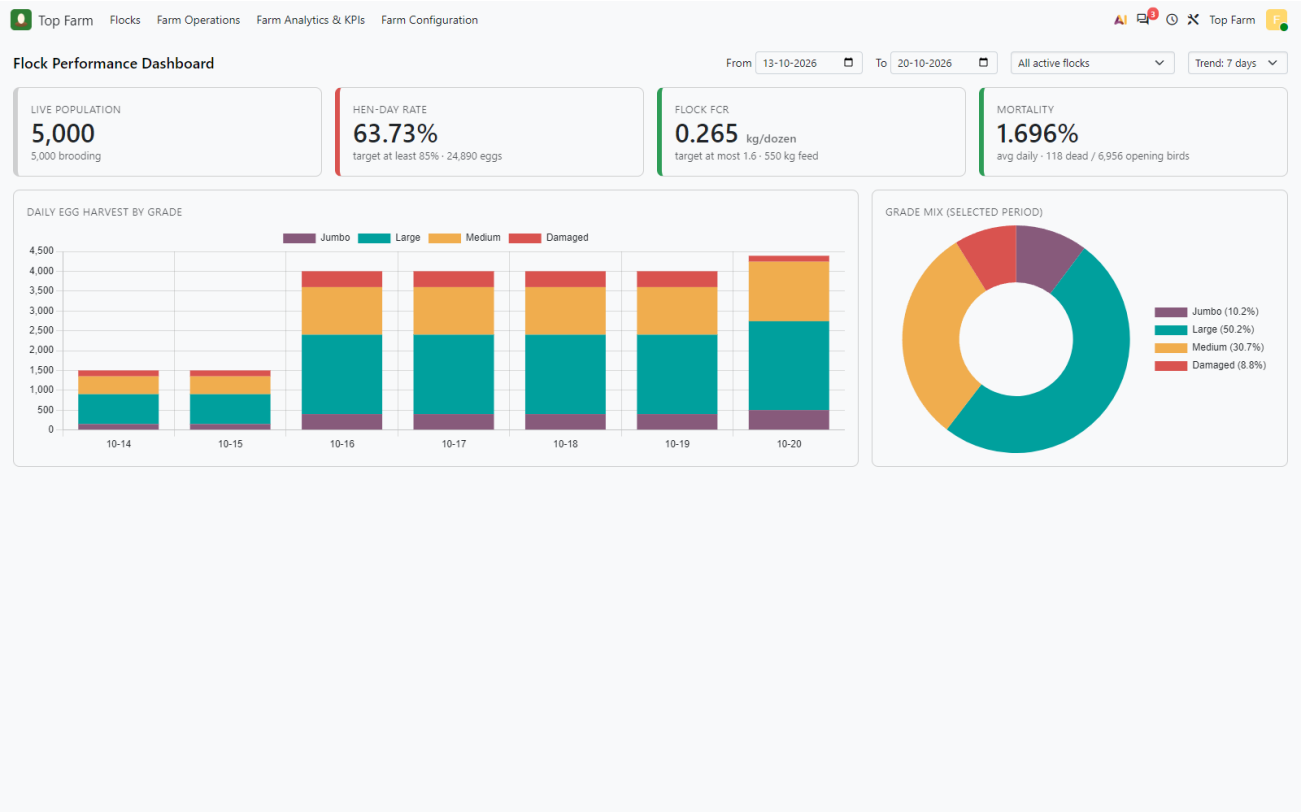

Figure 102. Flock Performance Dashboard, 13-20 October, all active flocks: live population by stage (the spent flock is no longer counted), hen-day rate, FCR, mortality, harvest by grade. The FCR is low because the period mixes pre-laying eggs, which carry no feed, with one laying day.

Figure 103: Flock Batches at the end of the test

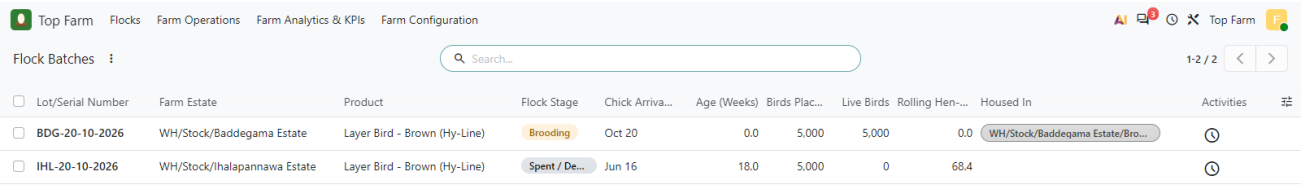

Figure 103. Flock Batches at the end of the test: IHL-20-10-2026 Spent / Depleted, BDG-20-10-2026 in Brooding.

13. Reusing the cages for the next flock

Cages and brooding nurseries are permanent: after a flock is depleted and the cages are cleaned, the next flock moves into the same cages. Each cage keeps its **cage analytic account for ever** (Farm Cages plan), while every flock gets a **new flock analytic account** (Flock Batches plan). Every cost line carries both, so a cage account accumulates the history of all its flocks, and the flock account on each line keeps them apart.

- **Per flock:** filter on the flock account: only that flock, whatever cages it used.
- **Per cage, all flocks:** filter on the cage account: the lifetime history of the cage.
- **One cage for one flock:** both accounts are on the same line; a pivot with the cages in rows and the flocks in columns splits them exactly.
- The allocation wizard only lets a flock into a cage that holds no other flock, so a cage never mixes two flocks at the same time.

In this test a second purchase of 4,000 chicks was dispatched to Ihalapannawa Brooding-01 and allocated into Cages A-01 to A-05 after the spent hens of IHL-20-10-2026 had left. Analytic items per cage, by flock (LKR, negative = net cost):

Cage	Cage account	IHL-20-10-2026 (before)	IHL-20-10-2026 (after)	IHL-20-10-2026-2	Expected	Result
Cage A-01	[A-01] IHL Cage A-01	-173,800.33	-173,800.33	-11,600.00	-11,600.00	PASS
Cage A-02	[A-02] IHL Cage A-02	-173,799.46	-173,799.46	-11,300.00	-11,300.00	PASS
Cage A-03	[A-03] IHL Cage A-03	-173,799.83	-173,799.83	-11,300.00	-11,300.00	PASS
Cage A-04	[A-04] IHL Cage A-04	-173,800.19	-173,800.19	-11,300.00	-11,300.00	PASS
Cage A-05	[A-05] IHL Cage A-05	-173,800.19	-173,800.19	-11,300.00	-11,300.00	PASS

The first flock's figures per cage (its rearing and laying costs, mortality and the spent hens it sold) did not change; the next flock's grower feed, vitamins and mortality land on the same cage accounts under its own account [IHL-20-10-2026-2] IHL-20-10-2026-2. In this same-day test the next flock is named IHL-20-10-2026-2, because IHL-20-10-2026 already holds the estate-date name; in production the next flock arrives weeks later and carries its own date.

Figure 104: The next chick purchase (4,000 birds

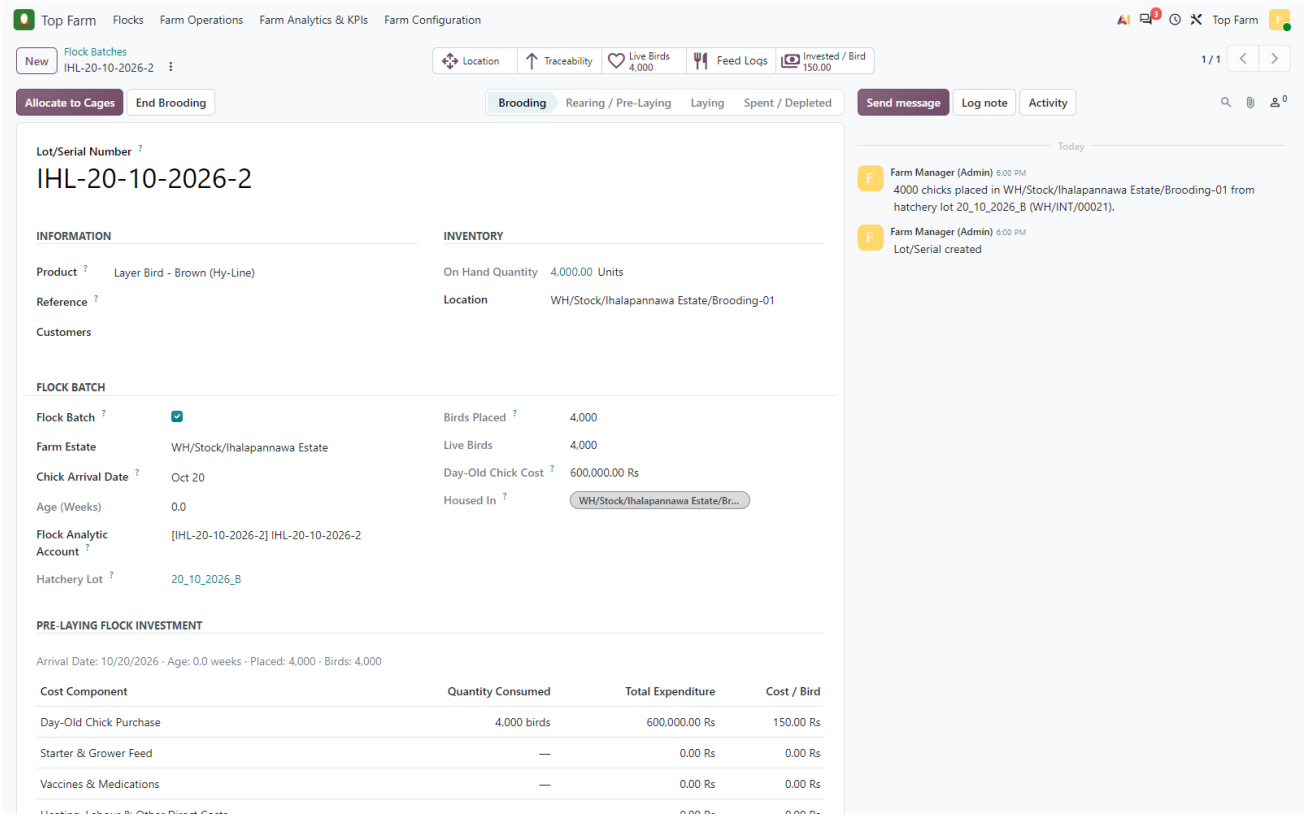

Figure 104. The next chick purchase (4,000 birds, hatchery lot 20_10_2026_B) dispatched to Ihalapannawa Brooding-01 becomes a new flock with its own analytic account. It is named IHL-20-10-2026-2 because the first flock already holds IHL-20-10-2026 (same estate, same date in this test); in production the next flock arrives weeks later and carries its own date.

Figure 105: Allocation wizard for the next flock

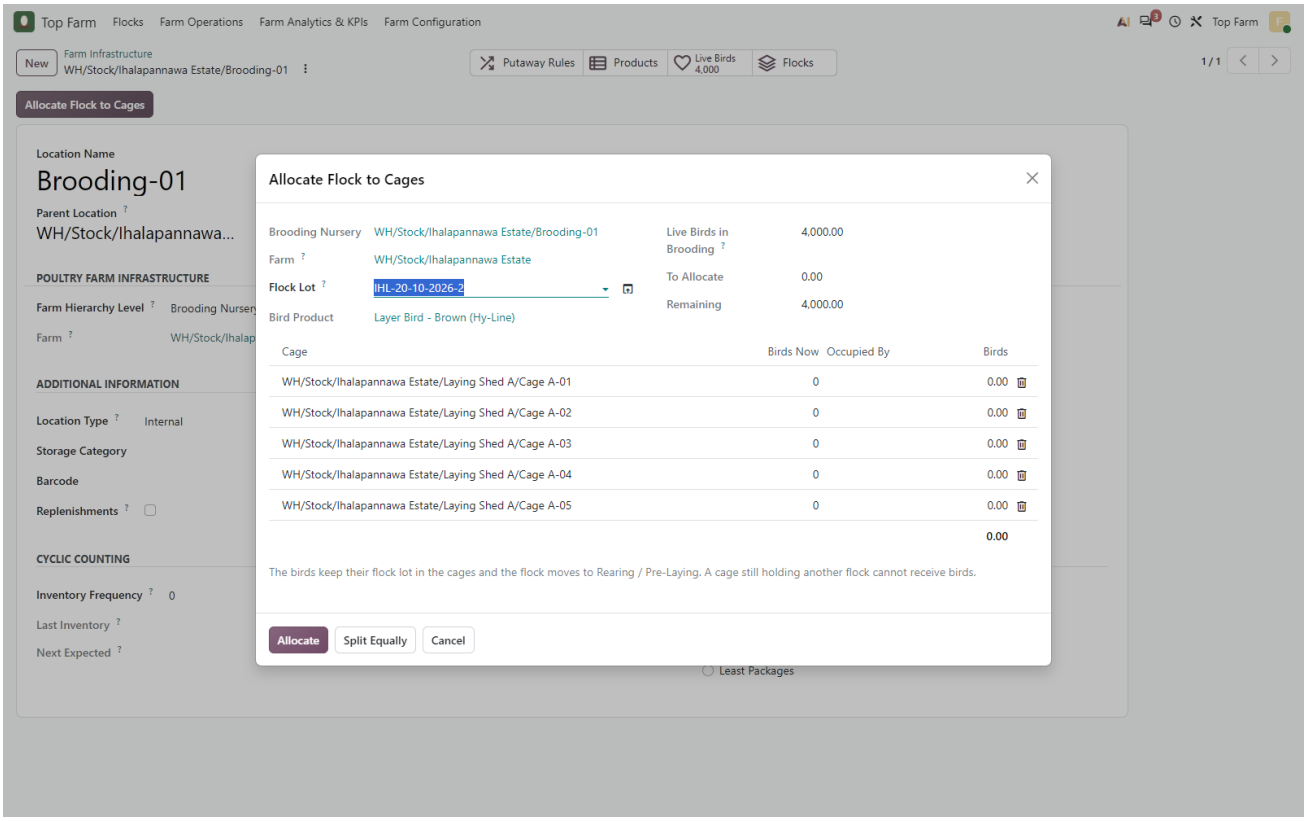

Figure 105. Allocation wizard for the next flock: the same 5 cages of Laying Shed A are listed; Birds Now 0 and no other flock in them, so they can receive the new flock. (A cage still holding another flock would be refused.)

15. Findings, fixes and notes

ID	Type	Finding	Resolution
F-1	Fixed	The analytic cost of birds leaving in one move from several cages (spent hen delivery) was not charged to the flock: the hook only looked at the move's source location (WH/Stock).	The hook now weighs each delivered line on its flock and cage accounts (5 analytic lines for the 5 cages). Checked by TC-10-09.
F-2	Fixed	The flock lifetime P&L counted egg revenue only, while the cost of the spent hens sold was a flock cost.	Spent hen sales are now flock revenue (Spent Hen Revenue) and the bird cost of sales has its own column. TC-10-15.
F-3	Fixed	In Approach B the dispatch transfer did not show which flock lot was generated.	The generated flock lot is written on the transfer line (Flock Lot column, figure of section 5).
F-4	Fixed	Unharvested laying feed expensed on the day of the transition counted in the locked pre-laying investment.	Laying-phase feed is excluded from the investment whatever its date. TC-10-12.
F-5	Fixed	The Top Farm smart buttons used Font Awesome icon names, which Odoo 20 renders as a stray "-" next to the values.	Replaced by Odoo 20 icons (heart for Live Birds, grid for Cages, payments for Invested / Bird, ...).
F-6	Fixed	The Approach A refusal message showed a fixed example lot (IHL-19-10-2026), also for other estates.	The example is built from the destination estate code and the arrival date (e.g. BDG-20-10-2026). TC-03-03.
F-7	Fixed	A generated flock lot name already used by a flock that had left brooding would have put new chicks into that old flock.	Only a flock still in Brooding is topped up; otherwise the new flock gets a suffix (IHL-20-10-2026-2). TC-11-02.
F-8	Fixed	Spent hen revenue was reported on the flock but not on the cages, while the cost of the hens was split per cage.	Spent hen revenue is attributed to the cage the hens were delivered from (P&L by cage, revenue allocation).
N-1	Simulation	Flock age and first egg days simulated; spent hens sold right after the first laying day.	See section 1.4.
N-2	Note	Approach A in the plan ("standard Odoo, use_create_lots") cannot re-label a lot during an internal transfer: Odoo moves a lot unchanged.	The clerk types the flock lot in the Flock Lot column; the system re-labels the chicks on validation (section 5.1).
N-3	Note	The plan's GL codes 600000 / 610000 / 630000 collide with the generic chart; this test used 5101xx-5105xx.	Agree the final chart of accounts with Top Farm before go-live.
N-4	Harness	Odoo 20 occasionally answered the headless browser with "Session Expired".	The browser scripts log in again and repeat the step; no business data is affected.
N-5	Note	Totals of feed logs and quantity columns that mix vaccine doses and litres of electrolytes add different units.	Read them per product; the costs are always correct.
N-6	Note	The report was reviewed by independent reviewers (screenshots against captions, figures against the database by read-only SQL, text against the request) before release.	Their findings were corrected in this version.

Appendix A: How to reproduce

1. Create a database on Odoo 20.0 Enterprise with `Top-Farm/top_farm_addons` in the addons path and install top_farm_dashboard, purchase_stock, sale_management and accountant (database `topfarm20_flock`).
2. Serve it on port 8021: `test_scripts/run.sh serve`.
3. Point `TF_NODE_MODULES` to a folder holding the npm packages docx and playwright-core (Chrome must be installed), then run `test_scripts/run_all.sh`: it runs the data phases (p00-p10) and the browser phases (s00-s10) in order.
4. Build this document: `node test_scripts/report/gen_report.js`, then `python test_scripts/report/word_export.py Top_Farm_Flock_Workflow_Test_Report.docx` to refresh the table of contents and export the PDF.

Files: `screenshots/` (111 PNG files, numbered by section), `test_scripts/` (data, browser and report scripts, `results/` with the checks, captions and verification tables) and the PDF version of this document.
